Introduction

Thank you for purchasing the Belkin Dual-Band Wireless A+G Router (the Router). The following two short sections discuss the benefits of home networking and outline best practices for maximizing your wireless home network range and performance. Please be sure to read through this User Manual completely, and pay special attention to the section entitled “Placement of your Router for Optimal Performance” on page 2. By following our simple setup instructions you will be able to use your Belkin Home Network to:

- Share one high-speed Internet connection with all the computers in your home
- Share resources, such as files and hard drives among all the connected computers in your home
- Share a single printer with the entire family
- Share documents, music, video, and digital pictures
- Store, retrieve, and copy files from one computer to another
- Simultaneously play games online, check Internet email, and chat

Advantages of a Wireless Network

- **Mobility** – you no longer need a dedicated “computer room”—you can work on a networked laptop or desktop computer anywhere within your wireless range
- **Easy installation** – The Belkin Easy Installation Wizard makes setup simple
- **Flexibility** – set up and access printers, computers, and other networking devices from anywhere in your home
- **Easy expansion** – the wide range of Belkin networking products let you expand your network to include devices such as printers and gaming consoles
- **No cabling required** – you can spare the expense and hassle of retrofitting Ethernet cabling throughout the home or office
- **Widespread industry acceptance** – choose from a wide range of interoperable networking products

Placement of your Router for Optimal Performance

Important Factors for Placement and Setup

Your wireless connection will be stronger the closer your computer is to your Router. Typical indoor operating range for wireless devices is between 100 and 200 feet.

In the same way, your wireless connection and performance will degrade somewhat as the distance between your Router and connected devices increases. This may or may not be noticeable to you. As you move farther from your Router, connection speed may decrease. Factors that can weaken signals simply by getting in the way of your network's radio waves are metal appliances or obstructions, and walls.

If you have concerns about your network's performance that might be related to range or obstruction factors, try moving the computer to a position between five and 10 feet from the Router in order to see if distance is the problem. If difficulties persist even at close range, please contact Belkin Technical Support.

Note: While some of the items listed below can affect network performance, they will not prohibit your wireless network from functioning; if you are concerned that your network is not operating at its maximum effectiveness, this checklist may help.

1. Wireless Router Placement

Place your Router, the central connection point of your network, as close as possible to the center of your wireless network devices.

To achieve the best wireless network coverage for your “wireless clients” (i.e., computers enabled by Belkin Wireless Notebook Network Cards, Wireless Desktop Network Cards, and Wireless USB Adapters):

- Ensure that your Router's antennas are parallel to each other, and are positioned vertically (toward the ceiling). Your Router itself is positioned vertically, point the antennas as much as possible in an upward direction.
- In multistory homes, place the Router on a floor that is as close to the center of the home as possible. This may mean placing the Router on an upper floor.
- Try not to place the Router near a cordless 2.4GHz or 5GHz phone.

2. Avoid Obstacles and Interference

Avoid placing your Router near devices that may emit radio “noise”, such as microwave ovens. Dense objects that can inhibit wireless communication include:

- Refrigerators
- Washers and/or dryers
- Metal cabinets
- Large aquariums
- Metallic-based UV tinted windows

If your wireless signal seems weak in some spots, make sure that objects such as these are not blocking the signal’s path (between your computers and Router).

3. Cordless Phones

If the performance of your wireless network is impaired after attending to the above issues, and you have a cordless phone:

- Try moving cordless phones away from Routers and your wireless-enabled computers.
- Unplug and remove the battery from any cordless phone that operates on the 2.4 or 5GHz band (check the manufacturer’s information). If this fixes the problem, the phone may be interfering.
- If your phone supports channel selection, change the channel on the phone to the farthest channel from your wireless network. For example, change the phone to channel 1 and move your Router to channel 11. See your phone’s user manual for detailed instructions.
- If necessary, consider switching to a 900MHz cordless phone.

4. Choose the “Quietest” Channel for your Wireless Network

In locations where homes or offices are close together, such as apartment buildings or office complexes, there may be wireless networks nearby that can conflict with yours.

Use the Site Survey capabilities found in the Wireless Network Utility of your wireless adapter to locate any other wireless networks that are available (see your wireless adapter’s user

Introduction

manual), and move your Router and computers to a channel as far away from other networks as possible.

- Experiment with more than one of the available channels, in order to find the clearest connection and avoid interference from neighboring cordless phones or other wireless devices.
- For Belkin wireless networking products, use the detailed Site Survey and wireless channel information included with your wireless network card. See your network card's user guide for more information.

These guidelines should allow you to cover the maximum possible area with your Router. Should you need to cover an even wider area, we suggest the Belkin Wireless Range Extender/Access Point.

5. Secure Connections, VPNs, and AOL

Secure connections typically require a user name and password, and are used where security is important. Secure connections include:

- Virtual Private Network (VPN) connections, often used to connect remotely to an office network
- The "Bring Your Own Access" program from America Online (AOL), which lets you use AOL through broadband provided by another cable or DSL service
- Most online banking websites
- Many commercial websites that require a user name and password to access your account

Introduction

Secure connections can be interrupted by a computer's power management setting, which causes it to "go to sleep." The simplest solution to avoid this is to simply reconnect by rerunning the VPN or AOL software, or by re-logging into the secure website.

A second alternative is to change your computer's power management settings so it does not go to sleep; however, this may not be appropriate for portable computers. To change your power management setting in Windows, see the "Power Options" item in the Control Panel.

If you continue to have difficulty with Secure Connections, VPNs, and AOL, please review the steps above to be sure you have addressed these issues.

Overview

Product Features

In minutes you will be able to share your Internet connection and network your computers. The following is a list of features that make your new Belkin Dual-Band Wireless A+G Router an ideal solution for your home or small office network.

Works with Both PCs and Mac® Computers

The Router supports a variety of networking environments including Mac OS® 8.x, 9.x, X v10.x, AppleTalk®, Linux®, Windows® 95, 98, Me, NT®, 2000, and XP, and others. All that is needed is an Internet browser and a network adapter that supports TCP/IP (the standard language of the Internet).

LED Display

Lighted LEDs on the top of the Router indicate which functions are in operation.

Web-Based Advanced User Interface

You can set up the Router's advanced functions easily through your web browser, without having to install additional software onto the computer. There are no disks to install or keep track of and, best of all, you can make changes and perform setup functions from any computer on the network quickly and easily.

NAT IP Address Sharing

Your Router employs Network Address Translation (NAT) to share the single IP address assigned to you by your Internet Service Provider while saving the cost of adding additional IP addresses to your Internet service account.

SPI Firewall

Your Router is equipped with a firewall that will protect your network from a wide array of common hacker attacks including IP Spoofing, Land Attack, Ping of Death (PoD), Denial of Service (DoS), IP with zero length, Smurf Attack, TCP Null Scan, SYN flood, UDP flooding, Tear Drop Attack, ICMP defect, RIP defect, and fragment flooding.

Integrated 10/100 4-Port Switch

The Router has a built-in, four-port network switch to allow your wired computers to share printers, data and MP3 files, digital photos, and much more. The switch features automatic detection so it will adjust to the speed of connected devices. The switch will transfer data between computers and the Internet simultaneously without interrupting or consuming resources.

Overview

Universal Plug and Play (UPnP)

UPnP is a technology that offers seamless operation of voice messaging, video messaging, games, and other applications that are UPnP-compliant.

Support for VPN Pass-Through

If you connect to your office network from home using a VPN connection, your Router will allow your VPN-equipped computer to pass through the Router and to your office network.

Built-In Dynamic Host Configuration Protocol (DHCP)

Built-In Dynamic Host Configuration Protocol (DHCP) on-board makes for the easiest possible connection of a network. The DHCP server will assign IP addresses to each computer automatically so there is no need for a complicated networking setup.

Easy Install Wizard

The Easy Install Wizard takes the guesswork out of setting up your Router. This automatic software determines your network settings for you and sets up the Router for connection to your Internet Service Provider (ISP). In a matter of minutes, your Router will be up and running on the Internet.

Note: Easy Install Wizard software is compatible with Windows 98SE, Me, 2000, XP, and Mac OS 9.X and Mac OS X. If you are using another operating system, the Router can be set up using the Alternate Setup Method described in this User Manual (see page 20).

Integrated Dual 802.11g and 802.11a Wireless Access Points

108 A+G is an exciting new wireless technology that achieves data rates up to 108Mbps.

Integrated Parental Control Web Content Filter

Belkin has teamed with Cerberian, a leading content-filtering company, to bring you this unique feature. Your Belkin Dual-Band Wireless A+G Router is a home networking solution with an integrated web content filter that allows you to block unwanted or offensive web content before it makes it to your network.

Unlike other access-control products, Belkin Parental Control is built into our Router, so there is no software to install on any computer and you will never be charged a per-computer fee for the service. Your Router comes with a free six-month subscription, with no credit card required for this trial period. This lets you take advantage of Parental Control's capabilities right away.

Overview

Belkin Parental Control allows you to set up your own policies and block any website you want. There is also an optional reporting feature (fee-based) that allows you to get a report showing you every website that was visited from your network (refer to your Parental Control User Manual for more information).

MAC Address Filtering

For added security, you can set up a list of MAC addresses (unique client identifiers) that are allowed access to your network. Every computer has its own MAC address. Simply enter these MAC addresses into a list using the Web-Based Advanced User Interface and you can control access to your network.

Product Specifications

The Router has been designed to be placed on a desktop. All of the cables exit from the rear of the Router for better organization and utility. The LED indicators are easily visible on the FRONT of the Router to provide you with information about network activity and status.

Front Panel

1. Power Icon

The power icon (⏻) indicates the state of the Router. When the icon is BLINKING, the Router is booting up. When the icon is lighted SOLID, the Router is ready for use. When the light is off, the Router is not powered on.

OFF	Router is OFF
Blinking	Router is booting up
Solid Green	Router is ready for use

2. Wireless Network Icons

There are two wireless network icons on the front panel. 802.11g wireless activity is represented by the “G” icon and 802.11a wireless activity is represented by the “A” icon. The icons have three different states.

OFF	Wireless network is OFF
Slow Blinking	Wireless network is ready
Fast Blinking	Indicates wireless activity

3. LAN Port-Status LEDs

These icons are labeled 1–4 and correspond to the numbered ports on the rear of the Router. When a computer is properly connected to one of the LAN ports on the rear of the Router, the icon will light when a device is connected. When information is being sent over the port, the icon blinks rapidly.

4. WAN Light

This LED lights in GREEN to indicate that your modem is connected properly to the Router. It blinks rapidly when information is being sent over the port between the Router and the modem.

OFF	No connection to the modem
Solid	Good connection to the modem
Blinking	Data is being sent from the Router to the modem

5. Connected Light

The “Connected” light will light green when your Router has a connection to the Internet. The light will blink slowly while the Router is negotiating a connection to the Internet. The light will be OFF when the Router is disconnected from the Internet.

Rear Panel

6. Power Jack – GRAY

Connect the included 5V DC power supply to this jack.

7. Connections to Computers (LAN Ports) – BLUE

Connect your wired (non-wireless) computers to these ports. These ports are RJ45, 10/100 auto-negotiation, auto-uplinking ports for standard UTP category 5 or 6 Ethernet cable. The ports are labeled 1 through 4. These ports correspond to the numbered LEDs on the top of the Router.

8. Connection to Modem (Internet/WAN Port) – GREEN

This port is for connection to your cable or DSL modem. Use the cable that was provided with the modem to connect the modem to this port. Use of a cable other than the cable supplied with the cable modem may not work properly.

9. Reset Button

The “Reset” button is used in rare cases when the Router may function improperly. Resetting the Router will restore the Router’s normal operation while maintaining the programmed settings. You can also restore the factory default settings by using the “Reset” button. Use the restore option in instances where you may have forgotten your custom password.

Resetting the Router

Push and release the “Reset” button. The lights on the Router will momentarily flash. When the lights stop blinking, the reset is complete.

Restoring the Factory Defaults

Press and hold the “Reset” button for at least 10 seconds then release it. The lights on the Router will momentarily flash. When the lights stop blinking, the reset is complete.

10. Rotating Antennas

Both antennas can rotate 180 degrees and swivel up to 90 degrees to allow for optimal positioning of the antennas in either a desktop or wall-mount application. For best wireless performance, the antennas should always be pointing up.

Overview

System Requirements

- Broadband Internet connection such as a cable or DSL modem with RJ45 (Ethernet) connection
- At least one computer with an installed network interface adapter
- TCP/IP networking protocol installed on each computer
- RJ45 Ethernet networking cable
- Internet browser

Easy Install Wizard Software System Requirements

A PC with:

- Windows® 98SE, Me, 2000, or XP, or a Mac® computer running Mac OS® 9.x or OS X
- Minimum 64MB RAM
- Internet browser
- CD-ROM drive

Package Contents

- Belkin Dual-Band Wireless A+G Router
- Quick Installation Guide
- Belkin Easy Install Wizard Software CD
- Belkin RJ45 Ethernet Networking Cable
- Power Supply
- User Manual

Connecting and Configuring the Router

Setting Up the Router with the Easy Install Wizard

The following section describes how to set up the Router using the Easy Install Wizard software included in the CD. This software requires that your PC directly connected to your DSL or cable modem is running Windows 98SE, Me, 2000, XP, Mac OS 9.x, or Mac OS X and that your cable or DSL modem Internet connection is **active and working** at the time of installation.

If you do not have a CD-ROM drive or one of the required operating systems, please continue to the “Alternate Setup Method” section of this manual to install the Router.

Modem Requirements

Your cable or DSL modem must be equipped with an RJ45 Ethernet port. Many modems have both an RJ45 Ethernet port and a USB connection. If you have a modem with both Ethernet and USB, and are using the USB connection at this time, you will be instructed to use the RJ45 Ethernet port during the installation procedure. If your modem has only a USB port, you can request a different type of modem from your ISP, or you can, in some cases, purchase a modem that has an RJ45 Ethernet port on it.

Ethernet

USB

Connecting and Configuring the Router

Step 1 | Install

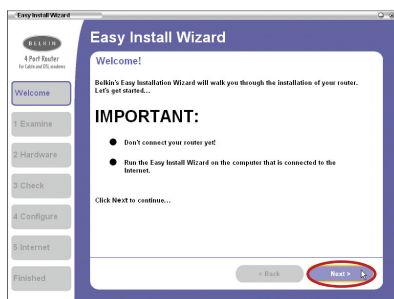

Important: Run the Easy Install Wizard software first!

- 1.1 **Do not connect the Router at this time.** From the computer that is directly connected to your high-speed cable or DSL modem, shut down any programs, firewall, and Internet-sharing software applications that are running.
- 1.2 **Windows Users:** Insert the Easy Install Wizard software CD into your CD-ROM drive. The Easy Install Wizard screen will automatically appear on your screen within 15 seconds. Click “Next” to start the setup.

Mac OS Users: Insert the CD into your CD-ROM drive. A drive will appear on your desktop called “Belkin Easy Install”. Double-click the drive to open it.

Mac OS 9 users—double-click the program called “Easy Install OS 9”.

Mac OS X users—double-click the program called “Easy Install OSX.dmg”. The Easy Install Wizard screen will appear. Click “Next” to start the setup.

Note for Windows Users: If the Easy Install Wizard does not start up automatically, select your CD-ROM drive from “My Computer” and double-click on the file named “EasyInstall.exe” on the CD-ROM.

Connecting and Configuring the Router

- 1.3 You will now see the first of a series of progress screens to help you know where you are in the setup process. Click “Next” to continue.

- 1.4 The next screen will tell you that the Wizard is examining your network settings. When the Wizard is finished examining your settings, click “Next”.

- 1.5 You may see the Multi NICs screen. This screen will appear ONLY if you have more than one network adapter installed in your computer. If you have more than one network card installed in your computer, the Wizard will need to know which adapter is connected to your modem. Select the network adapter that is connected to your modem from the list and click “Next”.

Connecting and Configuring the Router

Step 2 | Connect

Connect your Router to your computer and modem.

2.1 This step instructs you to locate the cable connected between your modem and the networking port on your computer. Unplug this cable from the computer and plug it into the GREEN port on the Router. Click “Next” to continue. (The color of your modem cable may vary from this setup image.)

2.2 This step instructs you to locate the BLUE cable that is included with your Router. Plug one end of this cable into ANY one of the BLUE ports on your Router. Plug the other end of the cable into the networking port on your computer. Click “Next” to continue.

2.3 This step instructs you to locate the power supply that is included with your Router. Plug the power supply's small connector into the GRAY port on the Router. Plug the power supply into an empty power outlet. Click “Next” to continue.

2.4 This step instructs you to look at the lights on the front of your Router. Make sure the appropriate lights are ON. Refer to the Easy Install Wizard software on your computer's screen for more details. Click “Next” to continue.

Connecting and Configuring the Router

Step 3 | Check

The Easy Install Wizard software will verify your connections.

3.1 Once you have completed connecting the Router, the Wizard will check the connection to the Router and then go on to determine what type of Internet connection you have.

3.2 If you have a connection type that requires a user name and a password (from a high-speed carrier that may require you to log on to access the Internet), you may see this screen. The Wizard will ask you to type in your user name and password. After entering this information, click “Next”.

Note: Your user name and password is provided to you by your Internet Service Provider. If you have to type in a user name and password to connect to the Internet, then type that same user name and password in here. Your user name looks something like “jsmith@myisp.com” or simply “jsmith”. The service name is optional and is very rarely required by your ISP. If you don’t know your service name, leave this blank.

Connecting and Configuring the Router

3.3 The Wizard will now transfer all of the configuration information to the Router. This will take approximately one minute. During this time, do not turn off the Router or computer. The Router will restart itself at the end of this step.

3.4 The Wizard will now check for an Internet connection. This can take a few minutes. The Wizard may not detect a connection right away. If not, it will retry 10 times. The “Connected” light on the front panel of the Router will flash during this time. Please be patient through this process.

Note: If the Easy Install Wizard repeatedly displays an error message that says it cannot make an Internet connection, you may have to power cycle your modem in order to establish an Internet connection. This step will allow the modem to reconfigure itself properly to work with the router. Please follow the instructions below:

Sequence:

1. Unplug the power from the modem (supplied by your ISP).
2. Unplug the power from your Belkin Router.
3. Wait for five minutes.
4. Reconnect power to the modem.
5. Wait for the modem to power up (about one minute, please refer to the modem's documentation).
6. Reconnect power to the Router.
7. Check your Internet connection.

Connecting and Configuring the Router

- 3.5** When the Internet connection is complete, the Wizard will tell you that you are finished. The “Connected” LED on the front of the Router will be solid GREEN, indicating that the Router is now connected to the Internet.

Begin surfing!

Congratulations! You have finished installing your new Belkin Router. To test your Internet connection, open your browser and visit any website, such as www.belkin.com. Upon connecting to the Internet through your new Router for the first time, a reminder screen for our included Parental Control Web Content Filter will appear. It will reappear every six hours until you click one of the choices (see image below). Please refer to your “Parental Control Web Content Filter” User Manual for detailed information.

Connecting and Configuring the Router

Alternate Setup Method

The following section describes how to set up the Router through an Internet browser. The setup method requires that your PC directly connected to your DSL or cable modem Internet connection is **active and working** at the time of installation.

Modem Requirements

Your cable or DSL modem must be equipped with an RJ45 Ethernet port. Many modems have both an RJ45 Ethernet port and a USB connection. If you have a modem with both Ethernet and USB, and are using the USB connection at this time, you will be instructed to use the RJ45 Ethernet port during the installation procedure. If your modem has only a USB port, you can request a different type of modem from your ISP, or you can, in some cases, purchase a modem that has an RJ45 Ethernet port on it.

Ethernet

USB

Connecting and Configuring the Router

Step 1 | Connect your Router

- 1.1 Turn off the power to your modem by unplugging the power supply from the modem.
- 1.2 Locate the network cable that is connected between your modem and your computer and unplug it from your computer, leaving the other end connected to your modem.
- 1.3 Plug the loose end of the cable you just unplugged into the port on the back of the Router labeled “Internet/WAN”.
- 1.4 Connect the included network cable from the back of the computer to one of the ports labeled “1–4”.
Note: It does not matter which numbered port you choose.
- 1.5 Turn your cable or DSL modem on by reconnecting the power supply to the modem.
- 1.6 Before plugging the power cord into the Router, plug the cord

Connecting and Configuring the Router

into the wall, then plug the cord into the Router's power jack.

- 1.7** Verify that your modem is connected to the Router by checking the lights on the TOP of the Router. The green light labeled "WAN" should be ON if your modem is connected correctly to the Router. If it is not, recheck your connections.
- 1.8** Verify that your computer is connected properly to the Router by checking the lights labeled "LAN 1,2,3,4". The light that corresponds to the numbered port connected to your computer should be ON, if your computer is connected properly. If it is not, recheck your connections.

Step 2 Set your computer's network settings to work with a DHCP server

See the section in this User Manual called "Manually Configuring Network Settings" for directions.

Step 3 Configure the Router using the Web-Based Advanced User Interface

Using your Internet browser, you can access the Router's Web-Based Advanced User Interface. In your browser, type "192.168.2.1" (do not type in anything else such as "http://" or "www"). Then press the "Enter" key.

Address	192.168.2.1
---------	-------------

Logging into the Router

You will see the Router's home page in your browser window. The home page is visible to any user who wants to see it. To make any changes to the Router's settings, you have to log in. Clicking the "Login" button or clicking on any one of the links on the home page will take you to the login screen. The Router ships with no password entered. In the login screen, leave the password blank and click the "Submit" button to log in.

The image shows a web browser window displaying the Router's login page. The page has a light blue header with the word "Login" in a darker blue font. Below the header, there is a paragraph of text: "Before you can change any settings, you need to log in with a password. If you have not yet set a custom password, then leave this field blank and click 'Submit.'" Below this text, there is a label "Password" in bold, followed by a text input field. Under the input field, it says "Default = leave blank" in a smaller, lighter blue font. At the bottom of the form, there are two buttons: a blue "Clear" button and a blue "Submit" button. The "Submit" button is highlighted with a red oval.

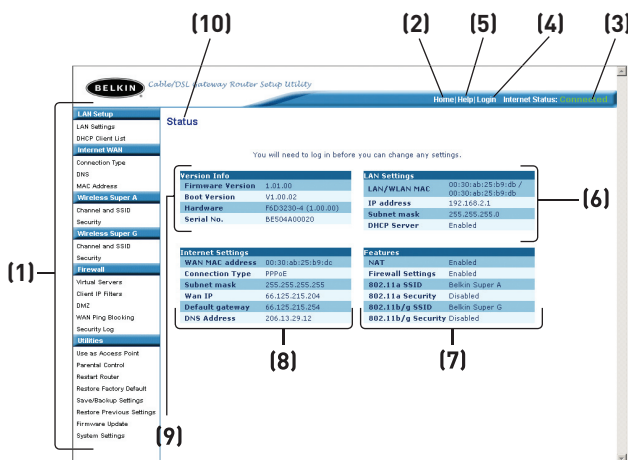

Logging out of the Router

One computer at a time can log into the Router for the purposes of making changes to the settings of the Router. Once a user has logged in to make changes, there are two ways that the computer can be logged out. Clicking the "Logout" button will log the computer out. The second method is automatic. The login will time out after a specified period of time. The default login timeout is 10 minutes. This can be set for any number of minutes from one to 99. For more information, see the section in this manual titled "Changing the Login Timeout Setting" on page 69.

Connecting and Configuring the Router

Understanding the Web-Based Advanced User Interface

The home page is the first page you will see when you access the Advanced User Interface (UI). The home page shows you a quick view of the Router's status and settings. All advanced setup pages can be reached from this page.

1. Quick-Navigation Links

You can go directly to any of the Router's advanced UI pages by clicking directly on these links. The links are divided into logical categories and grouped by tabs to make finding a particular setting easier to find. Clicking on the purple header of each tab will show you a short description of the tab's function.

2. Home Button

The home button is available in every page of the UI. Pressing this button will take you back to the home page.

3. Internet Status Indicator

This indicator is visible in all pages of the Router, indicating the connection status of the Router. When the indicator says "connection OK" in GREEN, the Router is connected to the Internet. When the Router is not connected to the Internet, the indicator will read "no connection" in RED. The indicator is automatically updated when you make changes to the settings of the Router.

4. Login/Logout Button

This button enables you to log in and out of the Router with the press of one button. When you are logged into the Router, this button will change to read “Logout”. Logging into the Router will take you to a separate login page where you will need to enter a password. When you are logged in to the Router, you can make changes to the settings. When you are finished making changes, you can log out of the Router by clicking the “Logout” button. For more information about logging into the Router, see the section called “Logging into the Router”.

5. Help Button

The “Help” button gives you access to the Router’s help pages. Help is also available on many pages by clicking “more info” next to certain sections of each page.

6. LAN Settings

Shows you the settings of the Local Area Network (LAN) side of the Router. Changes can be made to the settings by clicking on any one of the links (IP Address, Subnet Mask, DHCP Server) or by clicking the “LAN” quick-navigation link on the left side of the screen.

7. Features

Shows the status of the Router’s NAT, firewall, and wireless features. Changes can be made to the settings by clicking on any one of the links or by clicking the quick-navigation links on the left side of the screen.

8. Internet Settings

Shows the settings of the Internet/WAN side of the Router that connects to the Internet. Changes to any of these settings can be made by clicking on the links or by clicking on the “Internet/WAN” quick-navigation link on the left side of the screen.

9. Version Info

Shows the firmware version, boot-code version, hardware version, and serial number of the Router.

10. Page Name

The page you are on can be identified by this name. This manual will sometimes refer to pages by name. For instance “LAN > LAN Settings” refers to the “LAN Settings” page.

Connecting and Configuring the Router

Step 4 | Configuring your Router for Connection to your Internet Service Provider (ISP)

The “Internet/WAN” tab is where you will set up your Router to connect to your Internet Service Provider (ISP). The Router is capable of connecting to virtually any ISP’s system provided you have correctly configured the Router’s settings for your ISP’s connection type. Your ISP connection settings are provided to you by your ISP. To configure the Router with the settings that your ISP gave you, click “Connection Type” **(1)** on the left side of the screen. Select the connection type you use. If your ISP gave you DNS settings, clicking “DNS” **(2)** allows you to enter DNS address entries for ISPs that require specific settings. Clicking “MAC address” **(3)** will let you clone your computer’s MAC address or type in a specific WAN MAC address, if required by your ISP. When you have finished making settings, the “Internet Status” indicator will read “connection OK” if your Router is set up properly.

(1) points to **Internet WAN** in the left sidebar.
(2) points to **Connection Type** in the left sidebar.
(3) points to **DNS** in the left sidebar.

BELKIN Cable/DSL Gateway Router Setup Utility

Home | Help | Logout | Internet Status:

WAN >

The Internet/WAN Tab is where you will set up your Router to connect to your Internet Service Provider. The Router is capable of connecting to virtually any Internet Service Provider's system provided that you have correctly configured the Router's settings for your ISP's connection type. To configure the Router to connect to your ISP, click on "Connection type" on the Internet/WAN Tab on the left of the screen.

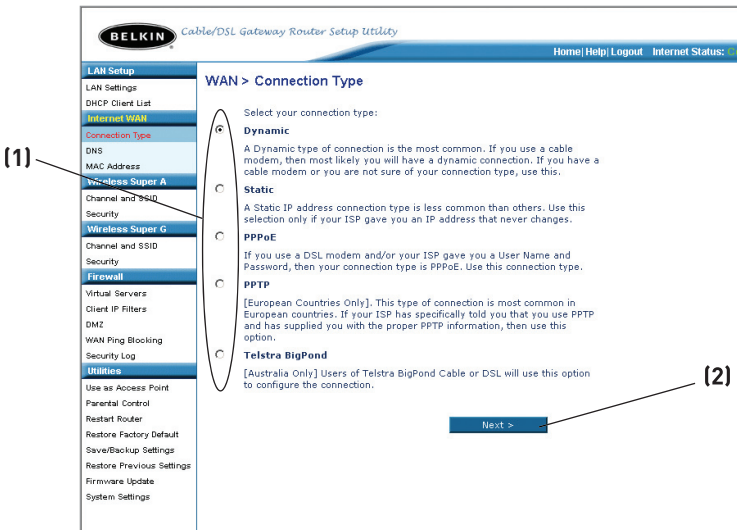

Connection types supported:

- **Dynamics:** including ISPs that require a host name and ISPs that bind the connection to a specific MAC address.
- **Static IP address:** the Router supports a connection to an ISP which assigns a static IP address.
- **PPPoE:** the Router supports a dynamic connection type which requires a PPPoE login for authentication.
- **PPTP:** For European users ONLY. The Router supports connections to European ISP's which connect via PPTP.
- **Telstra BigPond:** Australian users ONLY. The router supports connection to Telstra BigPond.

Connecting and Configuring the Router

Setting your Connection Type

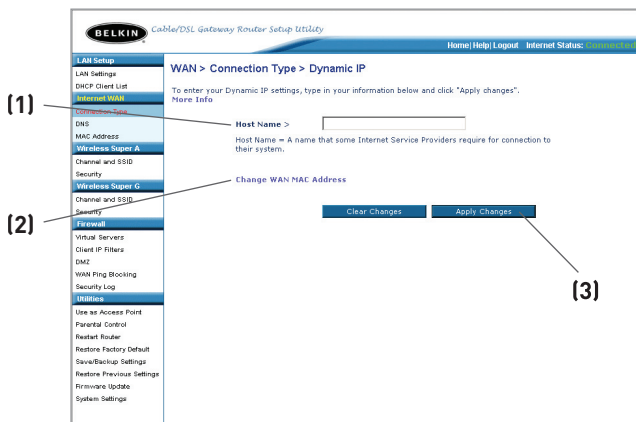

From the connection type page, you can select the type of connection you use. Select the type of connection you use by clicking the button **(1)** next to your connection type and then clicking “Next” **(2)**.

Connecting and Configuring the Router

Setting your Internet Service Provider (ISP) Connection Type to Dynamic IP

A dynamic connection type is the most common connection type found with cable modems. Setting the connection type to “dynamic” in many cases is enough to complete the connection to your ISP. Some dynamic connection types may require a host name. You can enter your host name in the space provided if you were assigned one. Your host name is assigned by your ISP. Some dynamic connections may require that you clone the MAC address of the PC that was originally connected to the modem.

1. Host Name

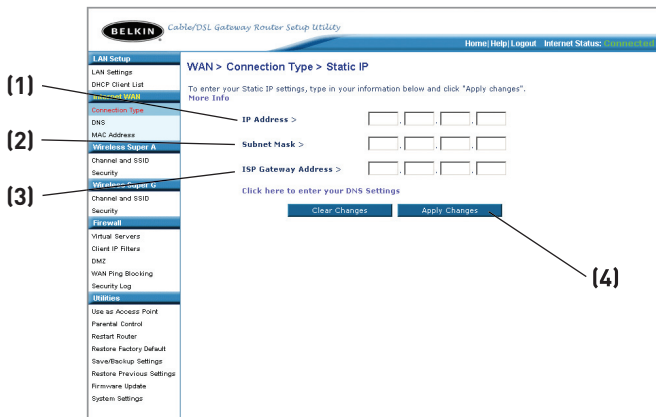

This space is provided to enter a host name that needs to be visible to your ISP. Enter your host name here and click “Apply Changes” (3). If your ISP did not assign you a host name, or you are not sure, leave this blank.

2. Change WAN MAC Address

If your ISP requires a specific MAC address to connect to the service, you can enter a specific MAC address or clone the current computer’s MAC address through this link.

Setting your Internet Service Provider (ISP) Connection Type to Static IP

A static IP address connection type is less common than other connection types. If your ISP uses static IP addressing, you will need your IP address, subnet mask, and ISP gateway address. This information is available from your ISP or on the paperwork that your ISP left with you. Type in your information, then click “Apply Changes” (4). After you apply the changes, the Internet Status indicator will read “connection OK” if your Router is set up properly.

1. IP Address

Provided by your ISP. Enter your IP address here.

2. Subnet Mask

Provided by your ISP. Enter your subnet mask here.

3. ISP Gateway Address

Provided by your ISP. Enter the ISP gateway address here.

Connecting and Configuring the Router

Setting your ISP Connection Type to PPPoE

Most DSL providers use PPPoE as the connection type. If you use a DSL modem to connect to the Internet, your ISP may use PPPoE to log you into the service. If you have an Internet connection in your home or small office that doesn't require a modem, you may also use PPPoE.

Your connection type is PPPoE if:

- a) Your ISP gave you a user name and password which is required to connect to the Internet.
- b) Your ISP gave you software such as WinPOET or Enternet300 that you use to connect to the Internet.
or
- c) You have to double-click on a desktop icon other than your browser to get on the Internet.

Connecting and Configuring the Router

WAN > Connection Type > PPPoE

To enter your PPPoE settings, type in your information below and click "Apply changes".
Here: Info

User Name >

Password >

Retype Password >

Service Name (Optional) >

MTU (1440-1454) >

Do not make changes to the MTU setting unless your ISP specifically requires a different setting than 1454. Here: Info

1. User Name

This space is provided to type in your user name that was assigned by your ISP.

2. Password

Type in your password and retype it into the "Retype Password" box to confirm it.

3. Service Name

A Service name is rarely required by an ISP. If you are not sure if your ISP requires a service name, leave this blank.

4. MTU

The MTU setting should never be changed unless your ISP gives you a specific MTU setting. Making changes to the MTU setting can cause problems with your Internet connection including disconnection from the Internet, slow Internet access, and problems with Internet applications working properly.

Connecting and Configuring the Router

Setting your Internet Service Provider (ISP) Connection Type to Point-to-Point Tunneling Protocol (PPTP)

[European Countries Only]. Some ISPs require a connection using PPTP protocol, a type of connection most common in European countries. This sets up a direct connection to the ISP's system. Type in the information provided by your ISP in the space provided. When you have finished, click "Apply Changes" (9). After you apply the changes, the Internet Status indicator will read "connection OK" if your Router is set up properly.

The screenshot shows the 'WAN > Connection Type > PPTP' configuration page in the Belkin Cable/DSL Gateway Router Setup Utility. The left sidebar contains a menu with options like LAN Setup, DHCP Client List, Internet WAN, Connection Type, DNS, MAC Address, Wireless Router A, Channel and Time, Security, Wireless Router G, Channel and SSID, Security, Firewall, Virtual Servers, Client Filters, DMZ, WAN Ping (Browsing), Security Log, Utilities, Use as Access Point, General Control, Restart Router, Restore Factory Default, Save/Backup Settings, Restore Previous Settings, Firmware Update, and System Settings. The main content area is titled 'WAN > Connection Type > PPTP' and includes a 'More Info' link. It contains several input fields: 'PPTP Account >', 'PPTP Password >', 'Retype Password >', 'Host Name >', 'Service IP Address >', 'My IP Address >', 'My Subnet Mask >', and 'Connection ID (optional) >'. There is also a checkbox for 'Disconnect after' followed by a field for 'minutes of no activity' and a 'More Info' link. A link 'Click here to enter your DNS Settings' is also present. At the bottom right, there are two buttons: 'Clear Changes' and 'Apply Changes'. Numbered callouts (1-9) point to specific elements: (1) points to the left sidebar menu, (2) points to the 'Internet WAN' option, (3) points to the 'PPTP Account' field, (4) points to the 'PPTP Password' and 'Retype Password' fields, (5) points to the 'Host Name' field, (6) points to the 'Service IP Address' field, (7) points to the 'My IP Address' and 'My Subnet Mask' fields, (8) points to the 'Connection ID (optional)' field, and (9) points to the 'Apply Changes' button.

- 1. PPTP Account**
Provided by your ISP. Enter your PPTP account name here.
- 2. PPTP Password**
Type in your password and retype it into the "Retype Password" box to confirm it.
- 3. Host Name**
Provided by your ISP. Enter your host name here.
- 4. Service IP Address**
Provided by your ISP. Enter your service IP address here.

Connecting and Configuring the Router

5. **My IP Address**

Provided by your ISP. Enter the IP address here.

6. **My Subnet Mask**

Provided by your ISP. Enter the IP address here.

7. **Connection ID (optional)**

Provided by your ISP. If your ISP did not give you a connection ID, leave this blank.

8. **Disconnect after X...**

The “Disconnect” feature is used to automatically disconnect the Router from your ISP when there is no activity for a specified period of time. For instance, placing a check mark next to this option and entering “5” into the minute field will cause the Router to disconnect from the Internet after five minutes of no Internet activity. This option should be used if you pay for your Internet service by the minute.

Connecting and Configuring the Router

Setting your Connection Type if you are a Telstra® BigPond User

[Australia Only] Your user name and password are provided to you by Telstra BigPond. Enter this information below. Choosing your state from the drop-down menu **(6)** will automatically fill in your login server IP address. If your login server address is different than one provided here, you may manually enter the login server IP address by placing a check in the box next to “User decide login server manually” **(4)** and type in the address next to “Login Server” **(5)**. When you have entered all of your information, click “Apply Changes” **(7)**. After you apply the changes, the Internet Status indicator will read “connection OK” if your Router is set up properly.

1. Select your State

Select your state from the drop-down menu **(6)**. The “Login Server” box will automatically be filled in with an IP address. If for some reason this address does not match the address that Telstra has given, you can manually enter the login server address. See “User decide login server manually” **(4)**.

2. User Name

Provided by your ISP. Type in your user name here.

3. Password

Type in your password and retype it into the “Retype Password” box to confirm it.

4. User Decide Login Server Manually

If your login server IP address is not available in the “Select Your State” drop-down menu **(6)**, you may manually enter the login server IP address by placing a check in the box next to “User decide login server manually” and type in the address next to “Login Server” **(5)**.

Setting Custom Domain Name Server (DNS) Settings

A “Domain Name Server” is a server located on the Internet that translates Universal Resource Locator (URLs) like “www.belkin.com” to IP addresses. Many Internet Service Providers (ISPs) do not require you to enter this information into the Router. The “Automatic from ISP” box **(1)** should be checked if your ISP did not give you a specific DNS address. If you are using a static IP connection type, then you may need to enter a specific DNS address and secondary DNS address for your connection to work properly. If your connection type is dynamic or PPPoE, it is likely that you do not have to enter a DNS address. Leave the “Automatic from ISP” box checked. To enter the DNS address settings, uncheck the “Automatic from ISP” box and enter your DNS entries in the spaces provided. Click “Apply Changes” **(2)** to save the settings.

Connecting and Configuring the Router

Configuring your WAN Media Access Controller (MAC) Address

All network components, including cards, adapters, and routers, have a unique “serial number” called a MAC address. Your Internet Service Provider may record the MAC address of your computer’s adapter and only let that particular computer connect to the Internet service. When you install the Router, its own MAC address will be “seen” by the ISP and may cause the connection not to work. Belkin has provided the ability to clone (copy) the MAC address of the computer into the Router. This MAC address, in turn, will be seen by the ISP’s system as the original MAC address and will allow the connection to work. If you are not sure whether your ISP needs to see the original MAC address, simply clone the MAC address of the computer that was originally connected to the modem. Cloning the address will not cause any problems with your network.

Connecting and Configuring the Router

1

2

3

4

5

6

7

8

9

Cloning your MAC Address

To clone your MAC address, make sure that you are using the computer that was **ORIGINALLY CONNECTED** to your modem before the Router was installed. Click the “Clone” button **(1)**. Click “Apply Changes” **(3)**. Your MAC address is now cloned to the Router.

Entering a Specific MAC Address

In certain circumstances you may need a specific WAN MAC address. You can manually enter one in the “MAC Address” page. Type in a MAC address in the spaces provided **(2)** and click “Apply Changes” **(3)** to save the changes. The Router’s WAN MAC address will now be changed to the MAC address you specified.

Subnet Mask > 255 . 255 . 255 . 0
[More Info](#)

DHCP server > ☒ On ☐ Off
The DHCP server function makes setting up a network very easy by assigning IP addresses to each computer on the network. It is not necessary to make any changes here. [More Info](#)

IP Pool Starting Address > 192 . 168 . 2 . 2
IP Pool Ending Address > 192 . 168 . 2 . 180

Lease Time > Half Hour
The length of time the DHCP server will reserve the IP address for each computer.

Local Domain Name > Belkin
(Optional)
A feature that lets you assign a name to your network. [More Info](#)

[Clear Changes](#) [Apply Changes](#)

1. IP Address

The "IP address" is the internal IP address of the Router. The default IP address is "192.168.2.1". To access the advanced setup interface, type this IP address into the address bar of your browser. This address can be changed if needed. To change the IP address, type in the new IP address and click "Apply Changes". The IP address you choose should be a non-routable IP.

Examples of a non-routable IP are:

192.168.x.x (where x is anything between 0 and 255)

10.x.x.x (where x is anything between 0 and 255)

172.y.x.x (where y is anything from 16 to 31, and x is anything between 0 and 255)

2. Subnet Mask

There is no need to change the subnet mask. This is a unique, advanced feature of your Belkin Router. It is possible to change the subnet mask if necessary; however, do **NOT** make changes to the subnet mask unless you have a specific reason to do so. The default setting is "255.255.255.0".

3. DHCP Server

The DHCP server function makes setting up a network very easy by assigning IP addresses to each computer on the network

Using the Web-Based Advanced User Interface

automatically. The default setting is “On”. The DHCP server can be turned OFF if necessary; however, in order to do so you must manually set a static IP address for each computer on your network. To turn off the DHCP server, select “Off” and click “Apply Changes”.

4. IP Pool

The range of IP addresses set aside for dynamic assignment to the computers on your network. The default is 2–100 (99 computers). If you want to change this number, you can do so by entering a new starting and ending IP address and clicking on “Apply Changes”. The DHCP server can assign 100 IP addresses automatically. This means that you cannot specify an IP address pool larger than 100 computers. For example, starting at 50 means you have to end at 150 or lower so as not to exceed the 100-client limit. The starting IP address must be lower in number than the ending IP address.

5. Lease Time

The length of time the DHCP server will reserve the IP address for each computer. We recommend that you leave the lease time set to “Forever”. The default setting is “Forever”, meaning that any time a computer is assigned an IP address by the DHCP server, the IP address will not change for that particular computer. Setting lease times for shorter intervals such as one day or one hour frees IP addresses after the specified period of time. This also means that a particular computer’s IP address may change over time. If you have set any of the other advanced features of the Router such as DMZ or client IP filters, these are dependent on the IP address. For this reason, you will not want the IP address to change.

6. Local Domain Name

The default setting is “Belkin”. You can set a local domain name (network name) for your network. There is no need to change this setting unless you have a specific advanced need to do so. You can name the network anything you want such as “MY NETWORK”.

Configuring the Wireless Network Settings

Your Belkin A+G Router is equipped with two wireless access points, one 802.11g and one 802.11a. Both access points run simultaneously (at the same time). Each has its own unique settings that can be adjusted independent of each other. This means that each will have its own SSID, Mode, Security, and Advanced settings. The following sections will tell you about making changes to these settings and more.

Disabling Wireless

In some cases, you may not want your wireless network ON. To disable the radio, place a check mark next to “Disable Super A Radio” or “Disable Super G Radio” then click “Apply Changes”. Keep in mind that the Super A and Super G settings are on separate pages.

Changing the Wireless Channel

There are a number of operating channels you can choose from with both 802.11g and 802.11a. Each have different numbered channels, but both work the same way. The channel can be changed if needed. If there are other wireless networks operating in your area, your network should be set to operate on a channel that is different than the other wireless networks.

1

2

3

4

5

6

7

8

9

Changing the Channel

For best performance, your Router should use a channel that is at least five channels away from the other wireless networks in the area. For instance, if another network is operating on channel 11, then set your network to channel 6 or below. To change the channel, select the channel from the drop-down list. Click “Apply Changes”. The change is immediate. Keep in mind that Super A and Super G settings are on different pages.

Using the Web-Based Advanced User Interface

Changing the Wireless Network Name (SSID)

To identify your wireless network, a name called the SSID (Service Set Identifier) is used. The SSID is your network name. The default network name of the Routers access points are as follows:

802.11g AP: Belkin_Super_G

802.11a AP: Belkin_Super_A

You can change these to anything you choose, or you can leave them unchanged. Keep in mind, if you decide to change your wireless network name, and there are other wireless networks operating in your area, your network name needs to be different from other wireless networks that may be operating in your area. To change the SSID, type in the SSID that you want to use in the SSID field **(1)** and click “Apply Changes” **(2)**. The change is immediate. If you make a change to the SSID, your wireless-equipped computers may also need to be reconfigured to connect to your new network name. Refer to the documentation of your wireless network adapter for information on making this change.

Using the Broadcast SSID Feature

Note: This advanced feature should be employed by advanced users only. For security, you can choose not to broadcast your network's SSID. Doing so will keep your network name hidden from computers that are scanning for the presence of wireless networks. To turn off the broadcast of the SSID, remove the check mark from the box next to "Broadcast SSID", and then click "Apply Changes". The change is immediate. Each computer now needs to be set to connect to your specific SSID; an SSID of "ANY" will no longer be accepted. Refer to the documentation of your wireless network adapter for information on making this change.

Super G Wireless Mode

The Super G wireless mode of the Router is shipped from the factory in the "g and b" mode, meaning it will seamlessly interoperate with 802.11b and 802.11g devices. Setting the Router's wireless mode to b only will allow only 802.11b devices to connect to the network. Setting the wireless mode to "Auto 108Mbps" will allow the Router to jump into the 108Mbps mode when possible. In this mode the Router constantly monitors the radio waves looking for interference or other networks. If neither of these is detected, the Router will jump into 108Mbps mode and remain there unless interference or another network is detected. "108Mbps only" mode will lock the Router into the 108Mbps mode. This mode is only recommended if there are absolutely no other 802.11g networks or interference in the space where you are operating your network. Interference can greatly and adversely affect the performance of the Router when locked into 108Mbps mode. To change the wireless mode, select the mode you want from the drop-down menu and click "Apply Changes".

Super Mode

Enabling Super mode will allow you to take advantage of the dynamic 108Mbps capability, real-time hardware data compression, dynamic transmit optimization and standards-compliant bursting. Setting the wireless mode to "Auto 108Mbps" and enabling Super mode will allow the Router to jump into Super mode when possible. The Router constantly monitors the radio waves looking for interference or other networks. If neither of these is detected, the Router will jump into Super mode and remain there unless interference or another network is detected. The Super mode is turned OFF at the factory. To enable Super mode, check the check box and click "Apply Changes".

Using the Web-Based Advanced User Interface

Super A Wireless Mode

The Super A wireless mode of the Router is shipped from the factory in the “a only” mode, meaning it will seamlessly interoperate with standard 802.11a devices. Setting the wireless mode to “Auto 108Mbps” will allow the Router to jump into the 108Mbps mode when possible. In this mode, the Router constantly monitors the radio waves looking for interference or other networks. If neither of these are detected, the Router will jump into 108Mbps mode and remain there unless interference or another network is detected. “108Mbps only” mode will lock the Router into the 108Mbps mode. This mode is only recommended if there are absolutely no other 802.11a networks or interference in the space where you are operating your network. Interference can greatly and adversely affect the performance of the Router when locked into 108Mbps mode. To change the wireless mode, select the mode you want from the drop-down menu and click “Apply Changes”.

Enable XR Mode

XR mode allows for extension of the operating range of the Router. By allowing devices to connect at lower than 1Mbps rates when the signal is weak (when the device is far from the Router), the connection can be maintained at much greater distances than normal. The Router ships from the factory with the XR mode ON. Unchecking the check box and clicking “Apply Changes” will disable the XR mode.

Disable AR Mode

AR mode, or Adaptive Radio mode, works only when the Router is in “Auto 108Mbps” wireless mode. AR uses a method by which the Router constantly monitors the radio waves looking for interference or other networks. If neither of these are detected, the Router will jump into 108Mbps mode and remain there unless interference or another network is detected. “108Mbps only” mode will lock the Router into the 108Mbps mode. Disabling the AR mode is generally not recommended unless there are absolutely no other networks or interference in the space where you are operating your network. Interference can greatly and adversely affect the performance of the Router in 108Mbps mode. AR mode is turned on at the factory. Checking the check box and clicking “Apply Changes” will disable the AR mode.

Transmit Power

The Super A+G technology used in your Router has great capabilities to reach farther than standard 802.11g or 802.11a technology. In some cases, the coverage area of the Router may exceed the area that you intend to cover. If so, you can reduce the power output of

the Router, effectively reducing the coverage area. If you are in a small space such as an apartment, you can reduce the coverage area to eliminate the possibility of neighbors using your network or the possibility of your network interfering with a neighboring network. The Transmit Power setting has been set to “Max” (Maximum) at the factory. To change the Transmit Power setting, select the power setting you want from the drop-down menu and click “Apply Changes”.

Changing the Wireless Security Settings

Your Router is equipped with the latest security standard called WPA (Wi-Fi® Protected Access). It also supports the legacy security standard called WEP (Wired Equivalent Privacy). Also included is 802.1x authentication using a server. By default, wireless security is disabled. To enable security, you will need to determine which standard you want to use. To access the security settings, click “Security” under each wireless (Super G and Super A) heading. Please note, security for Super A and Super G are separate. The security settings can be set the same or differently depending on what you want. To fully secure your wireless network, you will need to secure both the Super A and the Super G network.

Using the Web-Based Advanced User Interface

Setting WPA-PSK (No Server) Security

Note: To use WPA security, your clients must be capable of supporting WPA. If you are not sure, contact the manufacturer of your wireless card.

WPA-PSK uses what is known as a pre-shared key (PSK) as the security key. A pre-shared key is basically a password that is between eight and 40 characters long. It can be a combination of letters, numbers, or characters. Each client uses the same key to access the network. Typically this is the model that will be used in a home environment. It is recommended by the Wi-Fi Alliance that your key be at least 20 characters long and use a mixture of letters, numbers, and special characters (such as !, ", (,)). Try to make it easy to remember, like "tH15is@600d9@ssW0rD" (thisisagoodpassword).

Note: These directions work for both Super A and Super G security.

1. From the "Security Mode" drop-down menu, select "WPA-PSK (no server)".
2. For "Encryption Technique", select TKIP or AES. This setting will have to be identical on the clients that you set up.
3. Enter your pre-shared key. This can be from eight to 40 characters and can be letters, numbers, or symbols. This same key must be used on all of the clients that you set up.
4. Click "Apply Changes" to finish. You must now set all clients to match these settings.

The screenshot shows a web-based configuration interface for WPA-PSK (No Server) security. It includes the following elements:

- Security Mode:** A dropdown menu set to "WPA-PSK (no server)".
- Encryption Technique:** A dropdown menu set to "TKIP" with a note "Default is TKIP".
- Pre-shared Key (PSK):** A text input field containing a masked key "XXXXXXXXXX".
- WPA-PSK (no server) description:** A text block explaining that the key is a password (8-63 characters) used by all clients. It includes a "More Info" link.
- Obscure PSK:** A checkbox that is checked.
- Action Buttons:** "Clear Changes" and "Apply Changes" buttons at the bottom.

Setting WPA (with server) Security

If your network uses a radius server to distribute keys to the clients, use this setting.

1. From the “Security Mode” drop-down menu, select “WPA (with server)”.
2. For “Encryption Technique”, select TKIP or AES. This setting will have to be identical on the clients that you set up.
3. Enter the IP address of the radius server into the “Radius Server” fields.
4. Enter the radius key into the “Radius Key” field.
5. Enter the key interval. Key interval is how often the keys are distributed (in packets).
6. Click “Apply Changes” to finish. You must now set all clients to match these settings.

Using the Web-Based Advanced User Interface

Setting WEP Encryption (64-bit, 128-bit)

Note to Mac users: The passphrase option will not operate with Apple® AirPort®. To configure encryption for your Mac computer, set the encryption using the manual method described in the next section.

1. Select “128-bit WEP” or “64-bit WEP” from the drop-down menu.

Security Mode: 128bitWEP

Hex key grid (13 hex digit pairs):

NOTE: To automatically generate hex pairs using a PassPhrase, input it here

PassPhrase: [text field] [generate]

☒ Obscure Key

[Clear Changes] [Apply Changes]

2. After selecting your WEP encryption mode, you can enter your WEP key manually by typing in the hex WEP key manually, or you can type in a passphrase in the “Passphrase” field and click “Generate” to create a WEP key from the passphrase. Click “Apply Changes” to finish. You must now set all of your clients to match these settings. Note on passphrases: The passphrase generation technique works with all Belkin wireless clients. It is not guaranteed to work with other brands of wireless clients. If you are using a mix of Belkin and other brands of products, it is recommended that you use a hex key. For more information on hex keys, see page 51 in this User Manual.

BELKIN 802.11a Wireless > Security

Security Mode: 128bitWEP

Hex key grid (13 hex digit pairs):

NOTE: To automatically generate hex pairs using a PassPhrase, input it here

PassPhrase: [text field] [generate]

☐ Obscure Key

[Clear Changes] [Apply Changes]

3. Encryption in the Router is now set. Each of your computers on your wireless network will now need to be configured with the same passphrase. Refer to the documentation of your wireless network adapter for information on making this change.

Using the Web-Based Advanced User Interface

Using a Hexadecimal Key for WEP Encryption

A hexadecimal key is a mixture of numbers and letters from A–F and 0–9. 64-bit keys are five two-digit numbers. 128-bit keys are 13 two-digit numbers. 64-bit keys are five two-digit numbers.

For instance:

AF 0F 4B C3 D4 = 64-bit key

C3 03 0F AF 0F 4B B2 C3 D4 4B C3 D4 E7 = 128-bit key

In the boxes below, make up your key by writing in two characters between A–F and 0–9. You will use this key to program the encryption settings on your Router and your wireless computers.

Example:

AF	1F	4B	C3	D4
----	----	----	----	----

64-bit:

--	--	--	--	--

128-bit:

--	--	--	--	--	--	--	--	--	--	--	--	--

Note to Mac users: Original Apple AirPort products support 64-bit encryption only. Apple AirPort 2 products can support 64-bit or 128-bit encryption. Apple AirPort Extreme uses up to 128-bit encryption. Please check your product to see which version you are using. If you cannot configure your network with 128-bit encryption, try 64-bit encryption.

Using the Web-Based Advanced User Interface

Using 802.1x Authentication

1. From the “Security Mode” drop-down menu, select “802.1x”.
2. Enter the IP address of the radius server into the “Radius Server” fields.
3. Enter the port that the radius server is listening on.
4. Enter the radius key into the “Radius Key” field.
5. Enter the re-key interval. Re-key interval is how often the keys are distributed (in seconds).
6. Click “Apply Changes” to finish. You must now set all clients to match these settings.

The screenshot shows a web-based configuration interface for 802.1x authentication. It includes the following fields and controls:

- Security Mode:** A dropdown menu with "802.1X" selected.
- Radius Server:** Four input fields for IP address, each containing "0".
- Radius Port:** An input field containing "1812".
- Radius Key:** A text input field.
- Re-Key Interval:** An input field containing "0" with "(seconds)" text to its right.
- Obscure Key:** A checkbox that is checked.
- Buttons:** Two buttons at the bottom, "Clear Changes" and "Apply Changes", both in blue.

Using the Access Point Mode

Note: This advanced feature should be employed by advanced users only. The Router can be configured to work as a wireless network access point. Using this mode will defeat the NAT IP sharing feature and DHCP server. In AP mode, the Router will need to be configured with an IP address that is in the same subnet as the rest of the network that you will bridge to. The default IP address is 192.168.2.254 and subnet mask is 255.255.255.0. These can be customized for your needs.

1. Enable the AP mode by selecting “Enable” in the “Use as Access Point only” page. When you select this option, you will be able to change the IP settings.
2. Set your IP settings to match your network. Click “Apply Changes”.
3. Connect a cable from the WAN port on the Router to your existing network.

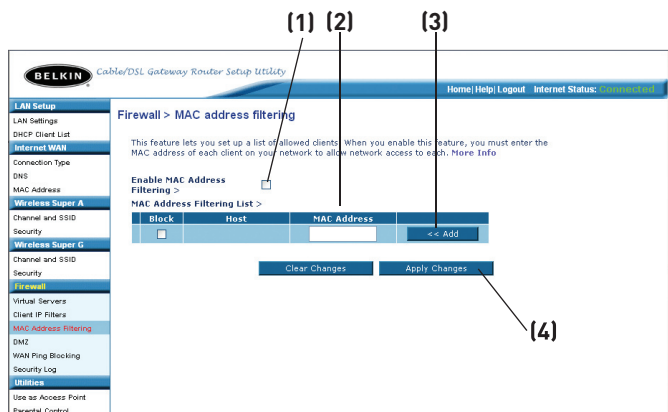

The Router is now acting as an A+G access point. To access the Router’s Advanced User Interface again, type the IP address you specified into your browser’s navigation bar. You can set the encryption settings, MAC address filtering, SSID, and channel normally.

Using the Web-Based Advanced User Interface

Setting MAC Address Filtering

The MAC address filter is a powerful security feature that allows you to specify which computers are allowed on the wireless network.

Note: This list applies only to wireless computers. This list can be configured so any computer attempting to access the wireless network that is not specified in the filter list will be denied access. When you enable this feature, you must enter the MAC address of each client (computer) to which you want to allow network access. The “Block” feature lets you turn on and off access to the network easily for any computer without having to add and remove the computer’s MAC address from the list.

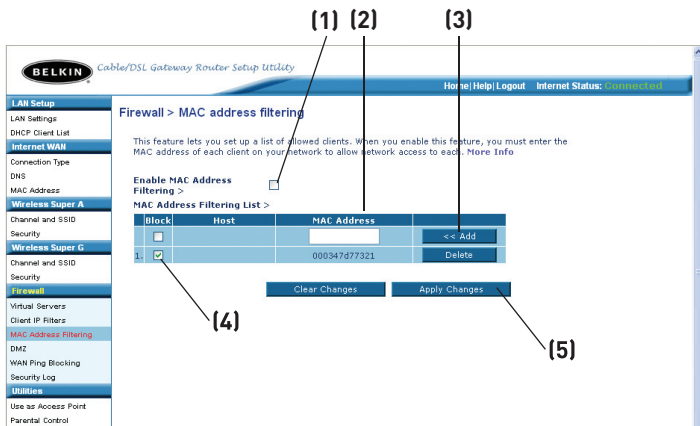

Setting up an Allow Access List

1. Check the “Enable MAC Address Filtering” box **(1)** to begin setting up a list of computers allowed to connect to the wireless network.
2. Next, in the “MAC Address” field that is blank **(2)**, type in the MAC address of the wireless computer you want to be able to access the wireless network, then click “<<Add” **(3)**.
3. Continue to do this until all of the computers you want to add have been entered.
4. Click “Apply Changes” **(4)** to finish.

Setting up a Block Access List

The “Block” list lets you specify computers that you DO NOT want to access the network. Any computer in the list will not be allowed access to the wireless network. All others will.

Using the Web-Based Advanced User Interface

Configuring the Firewall

Your Router is equipped with a firewall that will protect your network from a wide array of common hacker attacks including:

- IP Spoofing
- SYN flood
- Land Attack
- UDP flooding
- Ping of Death (PoD)
- Tear Drop Attack
- Denial of Service (DoS)
- ICMP defect
- IP with zero length
- RIP defect
- Smurf Attack
- Fragment flooding
- TCP Null Scan

The firewall also masks common ports that are frequently used to attack networks. These ports appear to be “stealth”, meaning that for all intents and purposes, they do not exist to a would-be hacker. You can turn the firewall function off if needed; however, it is recommended that you leave the firewall enabled. Disabling the firewall protection will not leave your network completely vulnerable to hacker attacks, but it is recommended that you leave the firewall enabled.

Firewall >

Your Router is equipped with a firewall that will protect your network from a wide array of common hacker attacks including Ping of Death (PoD) and Denial of Service (DoS) attacks. You can turn the firewall function off if needed. Turning off the firewall protection will not leave your network completely vulnerable to hacker attacks, but it is recommended that you turn the firewall on whenever possible.

Firewall Enable / Disable > ☐ Disable ☒ Enable

Apply Changes

Configuring Internal Forwarding Settings

The Virtual Servers function will allow you to route external (Internet) calls for services such as a web server (port 80), FTP server (Port 21), or other applications through your Router to your internal network. Since your internal computers are protected by a firewall, computers outside your network (over the Internet) cannot get to them because they cannot be “seen”. A list of common applications has been provided in case you need to configure the Virtual Server function for a specific application. If your application is not listed, you will need to contact the application vendor to find out which port settings you need.

BELKIN Cable/DSL Gateway Router Setup Utility

Home | Help | Logout | Internet Status: ●

Firewall > Virtual servers

This function will allow you to route external (Internet) calls for services such as a web server (port 80), FTP server (Port 21), or other applications through your Router to your internal network. [More Info](#)

Enable	Description	Type	Private IP address	Private port
<input type="checkbox"/>	1. <input type="text"/>	TCP	192.168.2. <input type="text"/>	<input type="text"/>
<input type="checkbox"/>	2. <input type="text"/>	TCP	192.168.2. <input type="text"/>	<input type="text"/>
<input type="checkbox"/>	3. <input type="text"/>	TCP	192.168.2. <input type="text"/>	<input type="text"/>
<input type="checkbox"/>	4. <input type="text"/>	TCP	192.168.2. <input type="text"/>	<input type="text"/>
<input type="checkbox"/>	5. <input type="text"/>	TCP	192.168.2. <input type="text"/>	<input type="text"/>
<input type="checkbox"/>	6. <input type="text"/>	TCP	192.168.2. <input type="text"/>	<input type="text"/>
<input type="checkbox"/>	7. <input type="text"/>	TCP	192.168.2. <input type="text"/>	<input type="text"/>
<input type="checkbox"/>	8. <input type="text"/>	TCP	192.168.2. <input type="text"/>	<input type="text"/>
<input type="checkbox"/>	9. <input type="text"/>	TCP	192.168.2. <input type="text"/>	<input type="text"/>
<input type="checkbox"/>	10. <input type="text"/>	TCP	192.168.2. <input type="text"/>	<input type="text"/>

Choosing an Application

Select your application from the drop-down list. Click “Add”. The settings will be transferred to the next available space in the screen. Click “Apply Changes” to save the setting for that application. To remove an application, select the number of the row that you want to remove then click “Clear”.

Manually Entering Settings into the Virtual Server

To manually enter settings, enter the IP address in the space provided for the internal (server) machine, the port(s) required to pass (use a comma between multiple ports), and then select the port type (TCP or UDP) and click “Apply Changes”. You can only pass one port per internal IP address. Opening ports in your firewall can pose a security risk. You can enable and disable settings very quickly. It is recommended that you disable the settings when you are not using a specific application.

Using the Web-Based Advanced User Interface

Setting Client IP Filters

The Router can be configured to restrict access to the Internet, email, or other network services at specific days and times. Restriction can be set for a single computer, a range of computers, or multiple computers.

Firewall > Client IP filters

The Router can be configured to restrict access to the Internet, e-mail or other network services at specific days and times. [More Info](#)

IP	Port	Type	Block Time	Day	Time	Enable
192.168.2.1		<input type="radio"/> TCP <input type="radio"/> UDP <input type="radio"/> BOTH	<input type="radio"/> Always <input type="radio"/> Block	SUN	12:00 A.M.	<input type="checkbox"/>
192.168.2.1		<input type="radio"/> TCP <input type="radio"/> UDP <input type="radio"/> BOTH	<input type="radio"/> Always <input type="radio"/> Block	SUN	12:00 A.M.	<input type="checkbox"/>
192.168.2.1		<input type="radio"/> TCP <input type="radio"/> UDP <input type="radio"/> BOTH	<input type="radio"/> Always <input type="radio"/> Block	SUN	12:00 A.M.	<input type="checkbox"/>

To restrict Internet access to a single computer, for example, enter the IP address of the computer you wish to restrict access to in the IP fields **(1)**. Next, enter “80” in both the port fields **(2)**. Select “Both” **(3)**. Select “Block” **(4)**. You can also select “Always” to block access all of the time. Select the day to start on top **(5)**, the time to start on top **(6)**, the day to end on the bottom **(7)**, and the time to stop **(8)** on the bottom. Select “Enable” **(9)**. Click “Apply Changes”. The computer at the IP address you specified will now be blocked from Internet access at the times you specified.

Note: Be sure you have selected the correct time zone under “Utilities> System Settings> Time Zone”.

IP	Port	Type	Block Time	Day	Time	Enable
192.168.2.22 ~ 22	80 ~ 80	<input type="radio"/> TCP <input type="radio"/> UDP <input checked="" type="radio"/> BOTH	<input type="radio"/> Always <input checked="" type="radio"/> Block	SUN SUN	12:00 A.M. 12:00 A.M.	<input checked="" type="checkbox"/>

(1) (2) (3) (4) (5) (6) (7) (8) (9)

Enabling the Demilitarized Zone (DMZ)

The DMZ feature allows you to specify one computer on your network to be placed outside of the firewall. This may be necessary if the firewall is causing problems with an application such as a game or video conferencing application. Use this feature on a temporary basis. The computer in the DMZ is NOT protected from hacker attacks.

Firewall > DMZ

DMZ
The DMZ feature allows you to specify one computer on your network to be placed outside of the NAT firewall. This may be necessary if the NAT feature is causing problems with an application such as a game or video conferencing application. Use this feature on a temporary basis. **The computer in the DMZ is not protected from hacker attacks.** To put a computer in the DMZ, enter the last digits of its IP address in the field below and select "Enable". Click "Submit" for the change to take effect. [More Info](#)

IP Address of Virtual DMZ Host >

	Static IP	Private IP	Enable
1.	66.125.212.102	192.168.2. <input type="text"/>	<input type="checkbox"/>

To put a computer in the DMZ, enter the last digits of its IP address in the IP field and select "Enable". Click "Apply Changes" for the change to take effect. If you are using multiple static WAN IP addresses, it is possible to select which WAN IP address the DMZ host will be directed to. Type in the WAN IP address you wish the DMZ host to direct to, enter the last two digits of the IP address of the DMZ host computer, select "Enable" and click "Apply Changes".

Blocking an ICMP Ping

Computer hackers use what is known as "pinging" to find potential victims on the Internet. By pinging a specific IP address and receiving a response from the IP address, a hacker can determine that something of interest might be there. The Router can be set up so it will not respond to an ICMP ping from the outside. This heightens your Router's security level.

Firewall > WAN Ping Blocking

ADVANCED FEATURE! You can configure the Router not to respond to an ICMP Ping (ping to the WAN port). This offers a heightened level of security. [More Info](#)

Block ICMP Ping > ☒ **(1)**

To turn off the ping response, select "Block ICMP Ping" **(1)** and click "Apply Changes". The Router will not respond to an ICMP ping.

Using the Web-Based Advanced User Interface

Utilities

The “Utilities” screen lets you manage different parameters of the Router and perform certain administrative functions.

Parental Control

See the included Parental Control User Manual for more information on the Parental Control feature.

Restarting the Router

Sometimes it may be necessary to restart or reboot the Router if it begins working improperly. Restarting or rebooting the Router will NOT delete any of your configuration settings.

Restarting the Router to Restore Normal Operation

1. Click the “Restart Router” button.

2. The following message will appear. Click “OK”.

3. The following message will appear. Restarting the Router can take up to 60 seconds. It is important not to turn off the power to the Router during the restart.

4. A 60-second countdown will appear on the screen. When the countdown reaches zero, the Router will be restarted. The Router home page should appear automatically. If not, type in the Router's address (default = 192.168.2.1) into the navigation bar of your browser.

Restoring Factory Default Settings

Using this option will restore all of the settings in the Router to the factory (default) settings. It is recommended that you back up your settings before you restore all of the defaults.

1. Click the “Restore Defaults” button.

2. The following message will appear. Click “OK”.

3. The following message will appear. Restoring the defaults includes restarting the Router. It can take up to 60 seconds. It is important not to turn the power to the Router off during the restart.

4. A 60-second countdown will appear on the screen. When the countdown reaches zero, the Router's defaults will be restored. The Router home page should appear automatically. If it does not, type in the Router's address (default = 192.168.2.1) into the navigation bar of your browser.

Using the Web-Based Advanced User Interface

Saving a Current Configuration

You can save your current configuration by using this feature. Saving your configuration will allow you to restore it later if your settings are lost or changed. It is recommended that you back up your current configuration before performing a firmware update.

Utilities > Save/Backup current settings

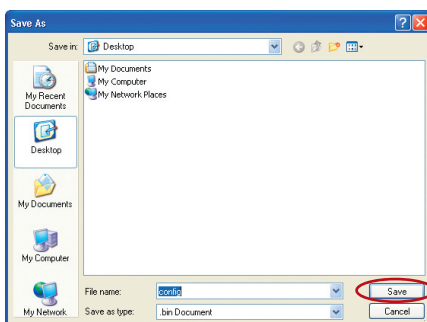

You can save your current configuration by using this feature. Saving your configuration will allow you to restore it later if your settings are lost or changed. It is recommended that you backup your current configuration before performing a firmware update.

Save

1. Click "Save". A window called "File Download" will open. Click "Save".

2. A window will open that allows you to select the location where you want to save the configuration file. Select a location. You can name the file anything you want, or use the default name "Config". Be sure to name the file so you can locate it yourself later. When you have selected the location and name of the file, click "Save".

Using the Web-Based Advanced User Interface

3. When the save is complete, you will see the following window. Click “Close”.

The configuration is now saved.

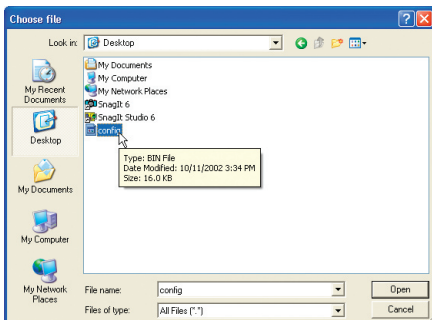

Restoring a Previous Configuration

This option will allow you to restore a previously saved configuration.

1. Click “Browse”. A window will open that allows you to select the location of the configuration file. All configuration files end with a “.bin”. Locate the configuration file you want to restore and double-click on it.

Using the Web-Based Advanced User Interface

2. You will be asked if you want to continue. Click “OK”.

3. A reminder window will appear. It will take up to 60 seconds for the configuration restoration to complete. Click “OK”.

4. A 60-second countdown will appear on the screen. When the countdown reaches zero, the Router's configuration will be restored. The Router home page should appear automatically. If not, type in the Router's address (default = 192.168.2.1) into the navigation bar of your browser.

Updating the Firmware

From time to time, Belkin may release new versions of the Router's firmware. Firmware updates contain feature improvements and fixes to problems that may exist. When Belkin releases new firmware, you can download the firmware from the Belkin update website and update your Router's firmware to the latest version.

Firmware Update

From time to time, Belkin may release new versions of the Router's firmware. Firmware updates contain improvements and fixes to problems that may have existed. Click the link below to see if there is a new firmware update available for this Router.

NOTE: Please backup your current settings before updating to a new version of firmware. [Click Here](#) to go to the Save/Backup current settings page.

Check For New Firmware Version

Update Firmware >

(1)

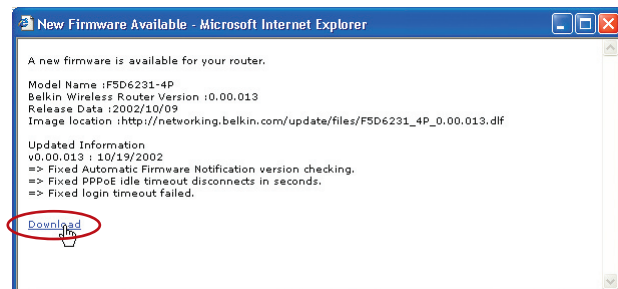

Checking for a New Version of Firmware

The "Check Firmware" (1) button allows you to instantly check for a new version of firmware. When you click the button, a new browser window will appear informing you that either no new firmware is available or that there is a new version available. If a new version is available, you will have the option to download it.

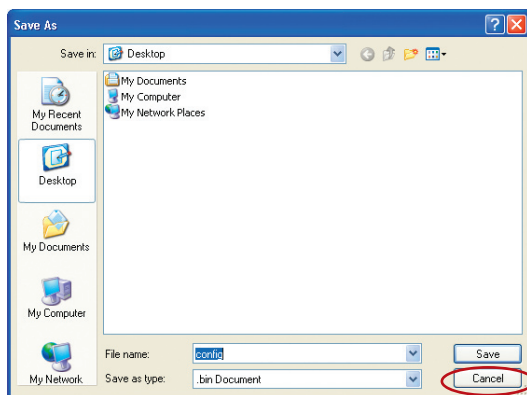

Using the Web-Based Advanced User Interface

Downloading a New Version of Firmware

If you click the “Check Firmware” button and a new version of firmware is available, you will see a screen similar to the one below.

1. To download the new version of firmware, click “Download”.
2. A window will open that allows you to select the location where you want to save the firmware file. Select a location. You can name the file anything you want, or use the default name. Be sure to save the file in a place where you can locate it yourself later. **Note:** We suggest saving this to your desktop to locate the file easily. When you have selected the location, click “Save”.

Using the Web-Based Advanced User Interface

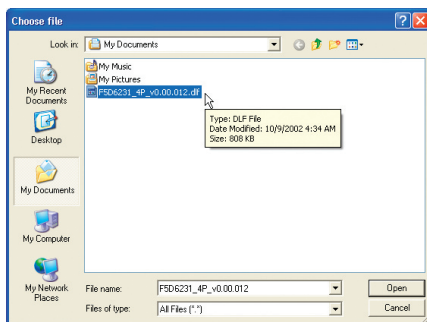

- When the save is complete, you will see the following window. Click “Close”.

The download of the firmware is complete. To update the firmware, follow the next steps in “Updating the Router’s Firmware”.

Updating the Router’s Firmware

- In the “Firmware Update” page, click “Browse” (2). A window will open that allows you to select the location of the firmware update file.
- Browse to the firmware file you downloaded. Select the file by double-clicking on the file name.

Using the Web-Based Advanced User Interface

3. The “Update Firmware” box will now display the location and name of the firmware file you just selected. Click “Update”.

4. You will be asked if you are sure you want to continue. Click “OK”.

5. You will see one more message. This message tells you that the Router may not respond for as long as one minute as the firmware is loaded into the Router and the Router is rebooted. Click “OK”.

6. A 60-second countdown will appear on the screen. When the countdown reaches zero, the Router firmware update will be complete. The Router home page should appear automatically. If not, type in the Router's address (default = 192.168.2.1) into the navigation bar of your browser.

Changing System Settings

The “System Settings” page is where you can enter a new administrator password, set the time zone, enable remote management, and turn on and off the NAT function of the Router.

Setting or Changing the Administrator Password

The Router ships with NO password entered. If you wish to add a password for greater security, you can set a password here. Write down your password and keep it in a safe place, as you will need it if you need to log into the Router in the future. It is also recommended that you set a password if you plan to use the remote management feature of your Router.

Administrator Password:
The Router ships with NO password entered. If you wish to add a password for more security, you can set a password here. [More Info](#)

- Type in current Password >

- Type in new Password >

- Confirm new Password >

- Login Timeout >

(1-99 minutes)

Changing the Login Timeout Setting

The login timeout option allows you to set the period of time that you can be logged into the Router’s advanced setup interface. The timer starts when there has been no activity. For example, you have made some changes in the advanced setup interface, then left your computer alone without clicking “Logout”. Assuming the timeout is set to 10 minutes, then 10 minutes after you leave, the login session will expire. You will have to login to the Router again to make any more changes. The login timeout option is for security purposes and the default is set to 10 minutes.

Note: Only one computer can be logged into the Router’s advanced setup interface at one time.

Using the Web-Based Advanced User Interface

Setting the Time and Time Zone

The Router keeps time by connecting to a Simple Network Time Protocol (SNTP) server. This allows the Router to synchronize the system clock to the global Internet. The synchronized clock in the Router is used to record the security log and control client filtering. Select the time zone that you reside in. If you reside in an area that observes Daylight Saving, then place a check mark in the box next to “Enable Daylight Saving”. The system clock may not update immediately. Allow at least 15 minutes for the Router to contact the time servers on the Internet and get a response. You cannot set the clock yourself.

Time and Time Zone:	April 22 , 2003 11:12:36 AM
Please set your time Zone. If you are in an area that observes daylight saving check this box. More Info	
- Time Zone >	(GMT-08:00) Pacific Time (US & Canada): Tijuana ▾
- Daylight Savings >	<input checked="" type="checkbox"/> Automatically Adjust Daylight Saving

Enabling Remote Management

Before you enable this advanced feature of your Belkin Router, **MAKE SURE YOU HAVE SET THE ADMINISTRATOR PASSWORD**. Remote management allows you to make changes to your Router's settings from anywhere on the Internet. There are two methods of remotely managing the Router. The first is to allow access to the Router from anywhere on the Internet by selecting “Any IP address can remotely manage the Router”. By typing in your WAN IP address from any computer on the Internet, you will be presented with a login screen where you need to type in the password of your Router. The second method is to allow a specific IP address only to remotely manage the Router. This is more secure, but less convenient. To use this method, enter the IP address you know you will be accessing the Router from in the space provided and select “Only this IP address can remotely manage the Router”. Before you enable this function, it is **STRONGLY RECOMMENDED** that you set your administrator password. Leaving the password empty will potentially open your Router to intrusion.

Remote Management:	
ADVANCED FEATURE! Remote management allows you to make changes to your Router's settings from anywhere on the Internet. Before you enable this function, MAKE SURE YOU HAVE SET THE ADMINISTRATOR PASSWORD . More Info

- Only this IP address can remotely manage the router>	<input type="text"/> . <input type="text"/> . <input type="text"/> . <input type="text"/>

Enabling/Disabling NAT (Network Address Translation)

Note: This advanced feature should be employed by advanced users only.

Before enabling this function, **MAKE SURE YOU HAVE SET THE ADMINISTRATOR PASSWORD.** Network Address Translation (NAT) is the method by which the Router shares the single IP address assigned by your ISP with the other computers on your network. This function should only be used if your ISP assigns you multiple IP addresses or you need NAT disabled for an advanced system configuration. If you have a single IP address and you turn NAT off, the computers on your network will not be able to access the Internet. Other problems may also occur. Turning off NAT will disable your firewall functions.

NAT Enabling:

ADVANCED FEATURE! Allows you to turn the Network Address Translation feature of the Router off. In almost every case you would NOT want to turn this feature off. [More Info](#)

- NAT Enable / Disable >

☒ Enable ☐ Disable

Enabling/Disabling UPnP

UPnP (Universal Plug-and-Play) is yet another advanced feature offered by your Belkin Router. It is a technology that offers seamless operation of voice messaging, video messaging, games, and other applications that are UPnP-compliant. Some applications require the Router's firewall to be configured in a specific way to operate properly. This usually requires opening TCP and UDP ports, and in some instances, setting trigger ports. An application that is UPnP-compliant has the ability to communicate with the Router, basically "telling" the Router which way it needs the firewall configured. The Router ships with the UPnP feature disabled. If you are using any applications that are UPnP-compliant, and wish to take advantage of the UPnP features, you can enable the UPnP feature. Simply select "Enable" in the "UPnP Enabling" section of the "Utilities" page. Click "Apply Changes" to save the change.

UPnP Enabling:

ADVANCED FEATURE! Allows you to turn the UPnP feature of the Router off. [More Info](#)

Using the Web-Based Advanced User Interface

Enabling/Disabling Auto Firmware Update

This innovation provides the Router with the built-in capability to automatically check for a new version of firmware and alert you that the new firmware is available. When you log into the Router's advanced interface, the Router will perform a check to see if new firmware is available. If so, you will be notified. You can choose to download the new version or ignore it.

Auto Update Firmware Enabling:

ADVANCED FEATURE! Allows you to update firmware automatically of the Router off. [More Info](#)

Manually Configuring Network Settings

Set up the computer that is connected to the cable or DSL modem **FIRST** using these steps. You can also use these steps to add computers to your Router after the Router has been set up to connect to the Internet.

Manually Configuring Network Settings in any Mac OS up to OS 9.x

1. Pull down the Apple menu. Select “Control Panels” and select “TCP/IP”.
2. You will see the TCP/IP control panel. Select “Ethernet Built-In” or “Ethernet” in the “Connect via:” drop-down menu **(1)**.

3. Next to “Configure” **(2)**, if “Manually” is selected, your Router will need to be set up for a static IP connection type. Write the address information in the table below. You will need to enter this information into the Router.

IP address:	<input type="text"/>
Subnet Mask:	<input type="text"/>
Router Address:	<input type="text"/>
Name Server Address:	<input type="text"/>

4. If not already set, at “Configure:”, choose “Using DHCP Server”. This will tell the computer to obtain an IP address from the Router.

5. Close the window. If you made any changes, the following window will appear. Click “Save”.

Restart the computer. When the computer restarts, your network settings are now configured for use with the Router.

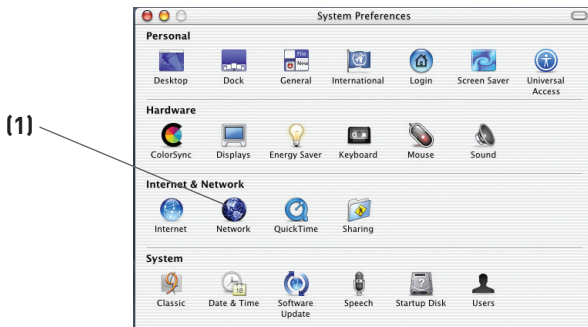

Manually Configuring Network Settings

Manually Configuring Network Settings in Mac OS X

1. Click on the “System Preferences” icon.

2. Select “Network” (1) from the “System Preferences” menu.

3. Select “Built-in Ethernet” (2) next to “Show” in the Network menu.

Manually Configuring Network Settings

4. Select the “TCP/IP” tab **(3)**. Next to “Configure” **(4)**, you should see “Manually” or “Using DHCP”. If you do not, check the PPPoE tab **(5)** to make sure that “Connect using PPPoE” is **NOT** selected. If it is, you will need to configure your Router for a PPPoE connection type using your user name and password.
5. If “Manually” is selected, your Router will need to be set up for a static IP connection type. Write the address information in the table below. You will need to enter this information into the Router.

IP address:	<input type="text"/>
Subnet Mask:	<input type="text"/>
Router Address:	<input type="text"/>
Name Server Address:	<input type="text"/>

6. If not already selected, select “Using DHCP” next to “Configure” **(4)**, then click “Apply Now”.

Your network settings are now configured for use with the Router.

Manually Configuring Network Settings

Manually Configuring Network Settings in Windows 2000, NT, or XP

1. Click “Start”, “Settings”, then “Control Panel”.
2. Double-click on the “Network and dial-up connections” icon (Windows 2000) or the “Network” icon (Windows XP).
3. Right-click on the “Local Area Connection” associated with your network adapter and select “Properties” from the drop-down menu.
4. In the “Local Area Connection Properties” window, click “Internet Protocol (TCP/IP)” and click the “Properties” button. The following screen will appear:
5. If “Use the following IP address” **(2)** is selected, your Router will need to be set up for a static IP connection type. Write the address

information the table below. You will need to enter this information into the Router.

6. If not already selected, select “Obtain an IP address automatically”

IP address:	<input type="text"/>
Subnet Mask:	<input type="text"/>
Default gateway:	<input type="text"/>
Preferred DNS server:	<input type="text"/>
Alternate DNS server:	<input type="text"/>

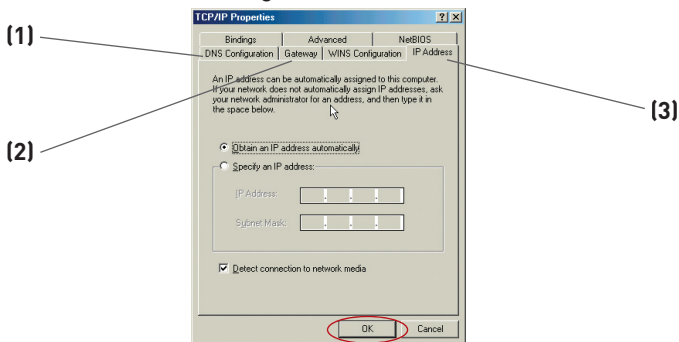

(1) and “Obtain DNS server address automatically” **(3)**. Click “OK”.

Your network settings are now configured for use with the Router.

Manually Configuring Network Settings

Manually Configuring Network Settings in Windows 98SE or Me

1. Right-click on “My Network Neighborhood” and select “Properties” from the drop-down menu.
2. Select “TCP/IP -> settings” for your installed network adapter. You will see the following window.

3. If “Specify an IP address” is selected, your Router will need to be set up for a static IP connection type. Write the address information in the table below. You will need to enter this information into the Router.
4. Write the IP address and subnet mask from the “IP Address” tab [3].
5. Click the “Gateway” tab [2]. Write the gateway address down in the chart.
6. Click the “DNS Configuration” tab [1]. Write the DNS address(es) in the chart.

IP address:	<input type="text"/>
Subnet Mask:	<input type="text"/>
Default gateway:	<input type="text"/>
Preferred DNS server:	<input type="text"/>
Alternate DNS server:	<input type="text"/>

7. If not already selected, select “Obtain IP address automatically” on the IP address tab. Click “OK”.

Restart the computer. When the computer restarts, your network settings are now configured for use with the Router.

Recommended Web Browser Settings

In most cases, you will not need to make any changes to your web browser's settings. If you are having trouble accessing the Internet or the Web-Based Advanced User Interface, then change your browser's settings to the recommended settings in this section.

Microsoft® Internet Explorer 4.0 or Higher

1. Start your web browser. Select “Tools” then “Internet Options”.

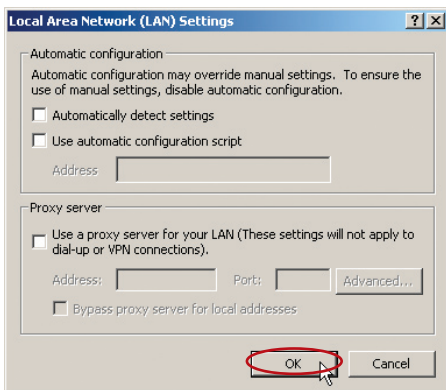

2. In the “Internet Options” screen, there are three selections: “Never dial a connection”, “Dial whenever a network connection is not present”, and “Always dial my default connection”. If you can make a selection, select “Never dial a connection”. If you cannot make a selection, go to the next step.

3. Under the “Internet Options” screen, click on “Connections” and select “LAN Settings...”.

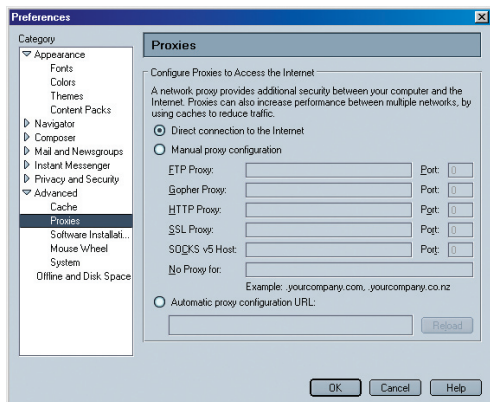

Recommended Web Browser Settings

4. Make sure there are no check marks next to any of the displayed options: “Automatically detect settings”, “Use automatic configuration script”, and “Use a proxy server”. Click “OK”. Then click “OK” again in the “Internet Options” page.

Netscape® Navigator® 4.0 or Higher

1. Start Netscape. Click on “Edit” then “Preferences”.
2. In the “Preferences” window, click on “Advanced” then select “Proxies”. In the “Proxies” window, select “Direct connection to the Internet”.

Setting up AOL for Broadband with the Router

There are two types of AOL connections available—either AOL DSL or AOL Cable. A third service is called AOL BYOA (Bring Your Own Access). This is used along with an existing broadband connection, supplied by your Internet Service Provider (ISP). If you have AOL DSL, please refer to “Directions for AOL DSL Users” below for setup instructions. If you have either AOL Cable or the AOL BYOA service, please go to the “Directions for AOL Cable or AOL BYOA Users” section of this guide, on page 87.

Directions for AOL DSL Users

- STEP 1:** Create AOL screen names for the Router and for each computer that will be using your AOL service.
- STEP 2:** Configure the Router for AOL for Broadband.
- STEP 3:** Configure your computers with the new AOL screen names you just created.

Step 1 | Creating new AOL screen names

Note: Your AOL connections must be set to operate on the TCP/IP standard. If you have designated another protocol, reset them to TCP/IP before proceeding.

1. If your Router is currently connected to the network, remove it from the network and connect it directly to your broadband modem. Then, log on to AOL as you normally do.
2. Log on to your AOL master account.

Setting up AOL for Broadband with the Router

3. Perform a keyword search on “names” by clicking “Keyword”, and then “Go to Keyword”.

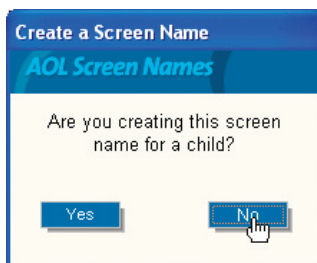

4. In the “Keyword” window, type in “names” then click “Go”.

5. You will see the “AOL Screen Names” window. Click “CREATE a Screen Name”.

6. A window will appear that asks whether the screen name is for a child. If you are creating the screen name for the Router, click “Yes” or “No” (it doesn’t matter which you select). If you are creating a screen name for an additional computer, select the appropriate answer.

Setting up AOL for Broadband with the Router

7. The “Choose a Screen Name” window will appear. Type in a screen name, and click “Continue”. If this screen name is for the Router, the name you choose should be something like your master screen name followed by the word Router. For instance “JohnSmithRouter”. If the screen name is for a computer, type in the screen name of the computer for which you are creating this screen name. Click “Continue”.

Step 1 of 4: Choose a Screen Name

AOL Screen Names

Step 1 of 4: Choose a Screen Name

Screen names can be between 3 to 16 characters and can contain letters, numbers, and spaces. The first character must be a letter and will be capitalized automatically. The rest of the characters will appear just as you enter them.

Reminder: When creating a screen name for a child, we recommend that you do not use your child's first or last name because a screen name is public and can be viewed by others online.

Examples: SkiRacer, Skat12345

Please enter the screen name you want to use:

JohnSmithRouter

Continue Cancel

8. The “Choose a password” screen will appear. Enter the password for this screen name twice, and click “Continue”.

Step 2 of 4: Choose a password

AOL Screen Names

Step 2 of 4: Choose a Password

Your password should be easy for you to remember, but hard for others to guess. If your AOL password can be easily guessed, your AOL account is not secure.

Reminder: America Online employees will never ask you for your password. **Never give your password to anyone and if you have children online, tell them their password is secret and should only be shared with a parent.**

To protect your AOL account, choose a password that:

- is at least 6 characters in length.
- includes a combination of numbers and letters (e.g. 1x56Ww).
- Does NOT contain your first or last name, your screen name, or other obvious words.

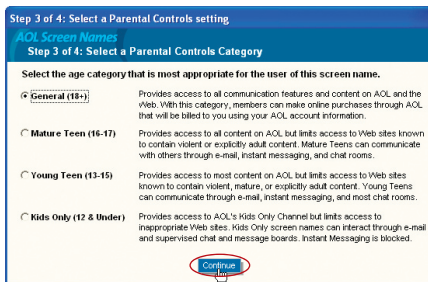

Please enter your password twice:

Continue Cancel

9. The “Select a Parental Controls setting” window will appear. If this screen name is for the Router, choose any one of the settings (it doesn’t matter which). If this screen name is for a computer, choose the desired setting and click “Continue”.

10. The “Confirm your Settings” window will appear. Select “Accept Controls”.

11. The “AOL Screen Names” window appears. This window will include all the screen names you have created to this point.

12. Repeat steps 1-11 to add an additional screen name for each computer that will be using AOL and that will be connected to the Router. When you are finished adding screen names, go to Step 2.

Setting up AOL for Broadband with the Router

Step 2 | Configuring the Router

Connect your Router to your network per the instructions in your User Manual.

1. Open your web browser.
2. In the address bar of your browser, type `http://192.168.2.1` and click “Go”. You will be directed to the Router’s home page. Click on “Connection Type” in the left-hand column under the “Internet WAN” heading.

Setting up AOL for Broadband with the Router

- 3. You will see the Router's login page. Leave the "Password" field **(2)** blank and click "Submit".

- 4. You will now see the PPPOE setup page.
- 5. In the "User Name" field **(1)**, type in the screen name that you created for your Router.
- 6. In the "Password" fields **(2)**, type in the password you created for the Router's screen name.
- 7. Leave the "Service Name" field **(3)** blank. Do not change the MTU setting.
- 8. Click on "Apply Changes" **(4)**.
- 9. Click on the Home link at the top of the screen. The Internet Status indicator should read "Connected" **(5)**.
- 10. Go to AOL DSL Users Step 3.

Setting up AOL for Broadband with the Router

Step 3 | **Configure your computers with the AOL screen names you just created**

This step consists of installing the AOL software on each computer and configuring it to use one of the screen names you created in Step 1. Remember that each computer **MUST** use a different screen name. For help installing and configuring the AOL software, contact AOL's technical support department.

Network Configuration

Setting up AOL for Broadband with the Router

Directions for AOL Cable or AOL BYOA (Bring Your Own Access) Users

AOL Cable users need to follow these directions. If you have AOL DSL, go to the “Directions for AOL DSL Users” section beginning on page 80.

STEP 1:

Create AOL screen names for each computer that will be using your AOL service.

STEP 2:

Configure your computers with the new AOL screen names you just created.

Step 1 | Creating new AOL screen names

Note: Your AOL connections must be set to operate on the TCP/IP standard. If you have designated another protocol, reset them to TCP/IP before proceeding.

1. Connect the Router to the network per the instructions in your User Manual. Once the Router is installed properly, go to the next step.
2. Log on to your AOL master account.
3. Perform a keyword search on “names” by clicking “Keyword”, and then “Go to Keyword”.
4. In the “Keyword” window, type in “names” then click “Go”.

8. The “Choose a password” screen will appear. Enter the password for this screen name twice, and click “Continue”.

Step 2 of 4: Choose a password
AOL Screen Names
Step 2 of 4: Choose a Password

Your password should be easy for you to remember, but hard for others to guess. If your AOL password can be easily guessed, your AOL account is not secure.

Reminder: America Online employees will never ask you for your password. Never give your password to anyone and if you have children online, tell them their password is secret and should only be shared with a parent.

To protect your AOL account, choose a password that:

- is at least 6 characters in length
- includes a combination of numbers and letters (e.g. 1x556w)
- Does NOT contain your first or last name, your screen name, or other obvious words.

Please enter your password twice:

Continue **Cancel**

9. The “Select a Parental Controls setting” window will appear. Choose the appropriate setting for this screen name. Click “Continue”.

Step 3 of 4: Select a Parental Controls setting
AOL Screen Names
Step 3 of 4: Select a Parental Controls Category

Select the age category that is most appropriate for the user of this screen name.

☒ **General (18+)** Provides access to all communication features and content on AOL and the Web. With this category, members can make online purchases through AOL that will be billed to you using your AOL account information.

☐ **Mature Teen (16-17)** Provides access to all content on AOL but limits access to Web sites known to contain violent or explicitly adult content. Mature Teens can communicate with others through e-mail, instant messaging, and chat rooms.

☐ **Young Teen (13-15)** Provides access to most content on AOL but limits access to Web sites known to contain violent, mature, or explicitly adult content. Young Teens can communicate through e-mail, instant messaging, and most chat rooms.

☐ **Kids Only (12 & Under)** Provides access to AOL's Kids Only Channel but limits access to inappropriate Web sites. Kids Only screen names can interact through e-mail and supervised chat and message boards. Instant Messaging is blocked.

Continue

10. The “Confirm your Settings” window will appear. Select “Accept Controls”.

Step 4 of 4: Confirm your Settings
AOL Screen Names
Step 4 of 4: Confirm your Settings John Smith Router

You have selected the **General (18+)** category for your new screen name. Please look for an e-mail from **AOL Welcome** with helpful information about your new screen name.

To use your new screen name, completely sign off of AOL, select your new screen name at the **Sign On** window, then sign on to AOL.

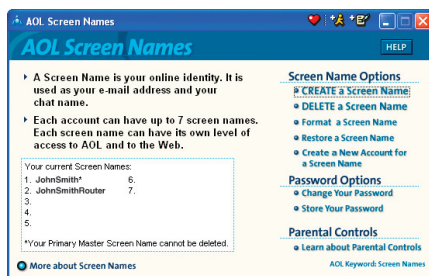

Remember: Mail Controls are the best way to limit unwanted e-mail. To use Mail Controls, visit **Keyword: Mail Controls**.

To accept the controls for the **General** category, click **Accept Controls**. To modify the controls for the **General** category, click **Edit Controls**.

Accept Controls **Edit Controls**

Recommended Web Browser Settings

11. The “AOL Screen Names” window appears. This window will include all the accounts you have created to this point.
12. Repeat steps 1-11 for each computer that will be using AOL and that will be connected to your Belkin Router. When you are finished adding screen names, go to Step 2.

Step 2 | Configure your computers with the new AOL screen names you just created

This step consists of installing the AOL software on each computer and configuring it to use one of the screen names you created in Step 1. Remember that each computer **MUST** use a different screen name. For help installing and configuring the AOL software, contact AOL's technical support department.

Network Configuration

Troubleshooting

Problem:

Installation CD does not automatically start

Solution:

If the CD-ROM does not start the Easy Install Wizard automatically, it could be that the computer is running other applications that are interfering with the CD drive.

1. If the Easy Install Wizard screen does not appear within 15-20 seconds, open up your CD-ROM drive by double-clicking on the “My Computer” icon that is located on your desktop.

2. Next, double-click on the CD-ROM drive that the Easy Installation CD has been placed in to start the installation.

3. Easy Install Wizard should start within a few seconds. If, instead, a window appears showing the files on the CD, double-click on the icon labeled “EasyInstall.exe”.

If the Easy Install Wizard is still does not start, reference the section titled “Manually Configuring Network Settings” (page 73 of this manual for an alternative setup method).

Troubleshooting

Problem:

The Easy Install Wizard cannot find my Router.

Solution:

If the Easy Install Wizard is not able to find the Router during the installation process, please check the following items:

1. If the Easy Install Wizard is not able to find the Router during the installation process, there may be third-party firewall software installed on the computer attempting to access the Internet. Examples of third-party firewall software are ZoneAlarm, BlackICE PC Protection, McAfee Personal Firewall, and Norton Personal Firewall.

If you do have firewall software installed on your computer, please make sure that you properly configure it. You can determine if the firewall software is preventing Internet access by temporarily turning it off. If, while the firewall is disabled, Internet access works properly, you will need to change the firewall settings to function properly when it is turned on.

Please refer to the instructions provided by the publisher of your firewall software for instructions on configuring the firewall to allow Internet access.

2. Unplug power to the Router for 10 seconds, and then plug the power back into the Router. Ensure that the Router's Power light is on; it should be solid green. If not, check to make sure that the AC adapter is connected to the Router and plugged into a wall outlet.
3. Ensure that you have a cable (use the cable included with the Router) connected between (1) the network (Ethernet) port on the back of the computer and (2) one of the LAN ports, labeled "1" through "4", on the back of the Router.

Note: The computer should NOT be connected to the port labeled "Internet/WAN" on the back of the Router.

4. Try shutting down and restarting your computer, then rerunning the Easy Install Wizard.

If the Easy Install Wizard is still unable to find the Router, reference the section titled "Manually Configuring Network Settings" for installation steps.

Problem:

The Easy Install Wizard cannot connect my Router to the Internet.

Solution:

If the Easy Install Wizard is not able to connect the Router to the Internet, please check the following items:

Note: If the Easy Install Wizard repeatedly displays an error message that says it cannot make an Internet connection, you may have to power cycle your modem in order to establish an Internet connection. This step will allow the modem to reconfigure itself properly to work with the Router. Please follow the instructions below:

Sequence:

1. Unplug the power from the modem (supplied by your ISP).
2. Unplug the power from your Belkin Router.
3. Wait for five minutes.
4. Reconnect power to the modem.
5. Wait for the modem to power up (about one minute, please refer to the modem's documentation).
6. Reconnect power to the Router.
7. Check your Internet connection.

If your ISP requires a user name and password, make sure that you have typed in your user name and password correctly. Some user names require that the ISP's domain may be at the end of the name. Example: "myname@myisp.com". The "@myisp.com" part of the user name may need to be typed as well as your user name.

If you continue to have no Internet connection, reference the section titled "Manually Configuring Network Settings" (page 73 of this manual for an alternative setup method).

Troubleshooting

Problem:

- The Easy Install Wizard completed installation, but my web browser doesn't work.
- I am unable to connect to the Internet. The "WAN" light on my Router is off, and the "Connected" light is blinking.

Solution:

If you cannot connect to the Internet, and the "WAN" light is off, and the "Connected" light is blinking, the problem may be that your modem and Router are not connected properly.

1. Make sure the network cable between the modem and the Router is connected. We strongly recommend using the cable that was supplied with your cable or DSL modem for this purpose. The cable should be connected at one end to the Router's "Internet/WAN" port, and at the other end to the network port on your modem.
2. Unplug the cable or DSL modem from its power source for three minutes. After three minutes, plug the modem back into its power source. This may force the modem to properly recognize the Router.
3. Unplug the power to your Router, wait 10 seconds, and then reconnect the power. This will cause the Router to reattempt communication with the modem.

If the "WAN" light on the Router is not lit after completing these steps, please contact Belkin Technical Support.

4. Try restarting your computer.

Problem:

- The Easy Install Wizard completed installation, but my web browser doesn't work.
- I am unable to connect to the Internet. The "WAN" light on my Router is on, and the "Connected" light is blinking.

Solution:

If you cannot connect to the Internet, the "WAN" light is on, and the "Connected" light is blinking, the problem may be that your connection type may not match the ISP's connection.

- If you have a "static IP address" connection, your ISP must assign you the IP address, subnet mask, and gateway address. Please refer to the section entitled "Alternate Setup Method" for details on changing this setting.

- If you have a “PPPoE” connection, your ISP will assign you a user name and password and sometimes a service name. Make sure the Router’s connection type is configured to PPPoE and the settings are entered properly. Please refer to the section entitled “Alternate Setup Method” for details on changing this setting.
- You may need to configure your Router to meet the specific requirements of your ISP. To search our Knowledge Base for ISP-specific issues, go to: <http://web.belkin.com/support> and type in “ISP”.

If you are still unable to access the Internet after verifying these settings, please contact Belkin Technical Support.

Problem:

- The Easy Install Wizard completed, but my web browser doesn’t work.
- I am unable to connect to the Internet. The “WAN” light on my Router is blinking, and the “Connected” light is solid.

Solution:

If the “WAN” light is blinking, and the “Connected” light is solid, but you are unable to access the Internet, there may be third-party firewall software installed on the computer attempting to access the Internet. Examples of third-party firewall software are ZoneAlarm, BlackICE PC Protection, McAfee Personal Firewall, and Norton Personal Firewall.

If you do have firewall software installed on your computer, please make sure that you properly configure it. You can determine if the firewall software is preventing Internet access by temporarily turning it off. If, while the firewall is disabled, Internet access works properly, you will need to change the firewall settings to function properly when it is turned on.

Please refer to the instructions provided by the publisher of your firewall software for instructions on configuring the firewall to allow Internet access.

If you are still unable to access the Internet after disabling any firewall software, please contact Belkin Technical Support.

Troubleshooting

Problem:

I can't connect to the Internet wirelessly.

Solution:

If you are unable to connect to the Internet from a wireless computer, please check the following items:

1. Look at the lights on your Router. If you're using a Belkin Router, the lights should be as follows:
 - The "Power" light should be on.
 - The "Connected" light should be on, and not blinking.
 - The "WAN Internet" light should be either on or blinking.
 - The "Wireless" light should be on or blinking.
2. Open your wireless utility software by clicking on the icon in the system tray at the bottom right-hand corner of the screen.
3. The exact window that opens will vary depending on the model of wireless card you have; however, any of the utilities should have a list of "Available Networks"—those wireless networks it can connect to.

Does the name of your wireless network appear in the results?

Yes, my network name is listed—go to the troubleshooting solution titled "I can't connect to the Internet wirelessly, but my network name is listed".

No, my network name is not listed—go to the troubleshooting solution titled "I can't connect to the Internet wirelessly, and my network name is not listed".

Problem:

I can't connect to the Internet wirelessly, but my network name is listed.

Solution:

If the name of your network is listed in the "Available Networks" list, please follow the steps below to connect wirelessly:

1. Click on the correct network name in the "Available Networks" list.
2. If the network has security (encryption) enabled, you will need to enter the network key. For more information regarding security, see the page entitled: "Setting WPA Security" or "Setting WEP Encryption".

3. Within a few seconds, the tray icon in the lower left-hand corner of your screen should turn green, indicating a successful connection to the network.

Problem:

I can't connect to the Internet wirelessly, and my network name is not listed.

Solution

If the correct network name is not listed under "Available Networks" in the wireless utility, please attempt the following troubleshooting steps:

1. Temporarily move computer, if possible, five to 10 feet from the Router. Close the wireless utility, and reopen it. If the correct network name now appears under "Available Networks", you may have a range or interference problem. Please see the suggestions discussed in the section titled "Placement of your Router" of this User Manual.
2. Using a computer that is connected to the Router via a network cable (as opposed to wirelessly), ensure that "Broadcast SSID" is enabled. This setting is found on the Router's wireless "Channel and SSID" configuration page.

If you are still unable to access the Internet after completing these steps, please contact Belkin Technical Support.

Problem:

My wireless network performance is inconsistent.

Data transfer is sometimes slow.

Signal strength is poor.

I am having difficulty establishing and/or maintaining a Virtual Private Network (VPN) connection.

Solution:

Wireless technology is radio-based, which means connectivity and the throughput performance between devices decreases when the distance between devices increases. Other factors that will cause signal degradation (metal is generally the worst culprit) are obstructions such as walls and metal appliances. Note also that connection speed may decrease as you move farther from the Router.

7

8

9

Troubleshooting

In order to determine if wireless issues are related to range, we suggest temporarily moving the computer, if possible, five to 10 feet from the Router.

Changing the wireless channel - Depending on local wireless traffic and interference, switching the wireless channel of your network can improve performance and reliability. The default channel the Router is shipped with is channel 11; you may choose from several other channels depending on your region. See the section on page 42 entitled “Changing the Wireless Channel” for instructions on how to choose other channels.

Limiting the wireless transmit rate - Limiting the wireless transmit rate can help improve the maximum wireless range, and connection stability. Most wireless cards have the ability to limit the transmission rate. To change this property, go to the Windows Control Panel, open the “Network Connections” and double-click on your wireless card’s connection. In the properties dialog, select the “Configure” button on the “General” tab (Windows 98 users will have to select the wireless card in the list box and then click “Properties”), then choose the “Advanced” tab and select the rate property. Wireless client cards are usually set to automatically adjust the wireless transmit rate for you, but doing so can cause periodic disconnects when the wireless signal is too weak; as a rule, slower transmission rates are more stable. Experiment with different connection rates until you find the best one for your environment. Note that all available transmission rates should be acceptable for browsing the Internet. For more assistance, see your wireless card’s user manual.

Problem:

I am having difficulty setting up Wired Equivalent Privacy (WEP) security on my Belkin Router (or Belkin Access Point).

Solution

1. Log into your Wireless Router or Access Point.
Open your web browser and type in the IP address of the Wireless Router (or Access Point). (The Router’s default is 192.168.2.1, the 802.11g Access Point is 192.168.2.254). Log into your Router by clicking on the “Login” button in the top, right-hand corner of the screen. You will be asked to enter your password. If you never set a password, leave the “Password” field blank and click “Submit”. Click the “Wireless” tab on the left of your screen. Select the “Encryption” or “Security” tab to get to the security settings page.

2. Select “128-bit WEP” from the drop-down menu.
3. After selecting your WEP encryption mode, you can type in your hex WEP key manually, or you can type in a passphrase in the “Passphrase” field and click “Generate” to create a WEP key from the passphrase. Click “Apply Changes” to finish. You must now set all of your clients to match these settings. A hex (hexadecimal) key is a mixture of numbers and letters from A-F and 0-9. For 128-bit WEP, you need to enter 26 hex characters.
For example:
C3 03 0F AF 4B B2 C3 D4 4B C3 D4 E7 E4 = 128-bit key
4. Click “Apply Changes” to finish. Encryption in the Wireless Router is now set. Each of your computers on your wireless network will now need to be configured with the same security settings.

WARNING: If you are configuring the Wireless Router (or Access Point) from a computer with a wireless client, you will need to ensure that security is turned on for this wireless client. If this is not done, you will lose your wireless connection.

Note to Mac users: Original Apple AirPort® products support 64-bit encryption only. Apple AirPort 2 products can support 64-bit or 128-bit encryption. Please check your Apple AirPort product to see which version you are using. If you cannot configure your network with 128-bit encryption, try 64-bit encryption.

Problem:

I am having difficulty setting up Wired Equivalent Privacy (WEP) security on a Belkin Wireless Card.

Solution:

The Wireless Card must use the same key as the Wireless Router. For instance, if your Wireless Router uses the key 00112233445566778899AABBCC, then the Wireless Card must be set to the exact same key.

1. Double-click the Signal Indicator icon to bring up the “Wireless Network” screen. The “Advanced” button will allow you to view and configure more options of your Card.
2. Once the “Advanced” button is clicked, the Belkin Wireless Utility will appear. This Utility will allow you to manage all the advanced features of the Belkin Wireless Card.
3. Under the “Wireless Network Properties” tab, select a

Troubleshooting

network name from the “Available networks” list and click the “Properties” button.

4. Under “Data Encryption”, select “WEP”.
5. Ensure that the check box “The key is provided for me automatically” at the bottom is unchecked. If you are using this computer to connect to a corporate network, please consult your network administrator if this box needs to be checked.
6. Type your WEP key in the “Network key” box.

Important: A WEP key is a mixture of numbers and letters from A–F and 0–9. For 128-bit WEP, you need to enter 26 characters. This network key needs to match the key you assign to your Wireless Router.

For example:

C3 03 0F AF 4B B2 C3 D4 4B C3 D4 E7 E4 = 128-bit key

7. Click “OK”, and then “Apply” to save the settings.
If you are not using a Belkin Wireless Card, please consult the manufacturer’s user manual for that wireless client card.

Problem:

Do Belkin products support WPA?

Solution:

Note: To use WPA security, all your clients must be upgraded to drivers and software that support WPA security. At the time of this publication, a security patch download is available, for free, from Microsoft. This patch works only with the Windows XP operating system.

You can find the patch to download from Microsoft by searching the knowledge base for Windows XP WPA. Click on the “Downloads” link. You will find a page entitled “Windows XP Support Patch for Wi-Fi Protected Access”.

You also need to download the latest driver for your Belkin 802.11g Wireless Desktop or Notebook Network Card from the Belkin support site. Other operating systems are not supported at this time. Microsoft’s patch only supports devices with WPA-enabled drivers such as Belkin 802.11g products.

Download the latest driver at <http://web.belkin.com/support>

Problem:

I am having difficulty setting up Wi-Fi Protected Access (WPA) security on a Belkin Wireless Router (or Belkin Access Point) for a home network.

Solution:

1. From the “Security Mode” drop-down menu, select “WPA-PSK (no server)”.
2. For “Encryption Technique”, select “TKIP” or “AES”. This setting will have to be identical on the clients that you set up.
3. Enter your pre-shared key. This can be from eight to 63 characters and can be letters, numbers, symbols, or spaces. This same key must be used on all of the clients that you set up. For example, your PSK might be something like: “Smith family network key”.
4. Click “Apply Changes” to finish. You must now set all clients to match these settings.

Problem:

I am having difficulty setting up Wi-Fi Protected Access (WPA) security on a Belkin Wireless Card for a home network.

Solution:

Clients must use the same key that the Wireless Router (or Access Point) uses. For instance, if the key is “Smith Family Network Key” in the Wireless Router (or Access Point), the clients must also use that same key.

1. Double-click the Signal Indicator icon to bring up the “Wireless Network” screen. The “Advanced” button will allow you to view and configure more options of your Card.
2. Once the “Advanced” button is clicked, the Belkin Wireless Utility will appear. This Utility will allow you to manage all the advanced features of the Belkin Wireless Card.
3. Under the “Wireless Network Properties” tab, select a network name from the “Available networks” list and click the “Properties” button.
4. Under “Network Authentication”, select “WPA-PSK (no server).”
5. Type your WPA key in the “Network key” box.

Troubleshooting

Important: WPA-PSK is a mixture of numbers and letters from A-Z and 0-9. For WPA-PSK you can enter eight to 63 characters. This network key needs to match the key you assign to your Wireless Router (or Access Point).

Click “OK,” then “Apply” to save the settings. I am NOT using a Belkin Wireless Card for a home network and I am having difficulty setting up Wi-Fi Protected Access (WPA) security.

If you are not using a Belkin Wireless Desktop or Wireless Notebook Network Card that is not equipped with WPA-enabled software, a file from Microsoft called “Windows XP Support Patch for Wireless (Wi-Fi) Protected Access” is available for free download. Download the patch from Microsoft by searching the knowledge base for Windows XP WPA.

Note: The file that Microsoft has made available works only with Windows XP. Other operating systems are not supported at this time. You also need to ensure that the wireless card’s manufacturer supports WPA and that you have downloaded and installed the latest driver from their support site.

Supported Operating Systems:

- Windows XP Professional
- Windows XP Home Edition

Problem:

Enabling WPA-PSK (no server)

Solution:

1. Under Windows XP, click “Start > Control Panel > Network Connections”.
2. Right-click on the “Wireless Networks” tab. Ensure the “Use Windows to configure my wireless network settings” check box is checked.
3. Under the “Wireless Networks” tab, click the “Configure” button.
4. For a home or small business user, select “WPA-PSK” under “Network Administration”.

Note: Select WPA (with radius server) if you are using this computer to connect to a corporate network that supports an authentication

server such as a radius server. Please consult your network administrator for further information.

5. Select “TKIP” or “AES” under “Data Encryption”. This setting will have to be identical to the Wireless Router (or Access Point) that you set up.

6. Type in your encryption key in the “Network Key” box.

Important: Enter your pre-shared key. This can be from eight to 63 characters and can be letters, numbers, or symbols. This same key must be used on all of the clients that you set up.

7. Click “OK” to apply settings.

What's the difference between 802.11b, 802.11g, 802.11a, and Pre-N?

Currently there are four levels of wireless networking standards, which transmit data at very different maximum speeds. Each is based on the designation 802.11(x), so named by the IEEE, the board that is responsible for certifying networking standards. The most common wireless networking standard, 802.11b, transmits information at 11Mbps; 802.11a and 802.11g work at 54Mbps or 108Mbps. Pre-N, the precursor to the upcoming 802.11n release, promises speeds that exceed 802.11g, and up to 800% the wireless coverage area. See the following chart for more detailed information.

Wireless Comparison Chart

Wireless Technology	802.11b	802.11g	802.11a+g	Belkin Pre-N
Speed	11Mbps	54Mbps	108Mbps	108Mbps
Frequency	Common household devices such as cordless phones and microwave ovens may interfere with the unlicensed band 2.4GHz	Common household devices such as cordless phones and microwave ovens may interfere with the unlicensed band 2.4GHz	Uses the uncrowded 5GHz band which is not susceptible to common household devices such as microwaves and cordless phones that use the 2.4GHz band	Common household devices such as cordless phones and microwave ovens may interfere with the unlicensed band 2.4GHz
Compatibility	Compatible with 802.11g	Compatible with 802.11b	Compatible with 802.11a, 802.11b, or 802.11g	Compatible with 802.11g or 802.11b
Coverage	Depends on interference - typically 100–200 ft. indoors	Depends on interference - typically 100–200 ft. indoors	Less interference in 802.11a - typically 100–200 ft. indoors	800% the coverage of standard 802.11g
Adoption	Mature – widely adopted	Expected to continue to grow in popularity	Popular in media devices and business environments	Expected to continue to grow in popularity

Wi-Fi® Interoperability Certificate

Wi-Fi
CERTIFIED
bg

This certificate represents the capabilities and features that have passed the interoperability testing governed by the Wi-Fi Alliance. Detailed descriptions of these features can be found at www.wi-fi.org/certificate

Certification Date: December 30, 2004
Category: Access Point
Company: Belkin Corporation
Product: BELKIN Dual-Band Wireless A+G Router
Model/SKU#: F8D3230-4

This product has passed Wi-Fi certification testing for the following standards:

IEEE Standard	Security		
802.11b 802.11g	WPA™ - Personal

FCC Statement

DECLARATION OF CONFORMITY WITH FCC RULES FOR ELECTROMAGNETIC COMPATIBILITY

We, Belkin Corporation, of 501 West Walnut Street,
Compton, CA 90220, declare under our sole
responsibility that the product,

F6D3230-4

to which this declaration relates, complies with Part 15
of the FCC Rules. Operation is subject to the following
two conditions: (1) this device may not cause harmful
interference, and (2) this device must accept any
interference received, including interference that may
cause undesired operation.

Caution: Exposure to Radio Frequency Radiation.

The radiated output power of this device is far below the FCC radio
frequency exposure limits. Nevertheless, the device shall be used in such a
manner that the potential for human contact during normal operation
is minimized.

When connecting an external antenna to the device, the antenna shall be
placed in such a manner to minimize the potential for human contact during
normal operation. In order to avoid the possibility of exceeding the FCC radio
frequency exposure limits, human proximity to the antenna shall not be less
than 20cm (8 inches) during normal operation.

Federal Communications Commission Notice

This equipment has been tested and found to comply with the limits for a
Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are
designed to provide reasonable protection against harmful interference in a
residential installation.

This equipment generates, uses, and can radiate radio frequency energy. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try and correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the distance between the equipment and the receiver.
- Connect the equipment to an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

Modifications

The FCC requires the user to be notified that any changes or modifications to this device that are not expressly approved by Belkin Corporation may void the user's authority to operate the equipment.

Canada-Industry Canada (IC)

The wireless radio of this device complies with RSS 139 & RSS 210 Industry Canada. This Class B digital apparatus complies with Canadian ICES-003.

Cet appareil numérique de la classe B conforme à la norme NMB-003 du Canada.

Europe-European Union Notice

Radio products with the CE 0682 or CE alert marking comply with the R&TTE Directive (1995/5/EC) issued by the Commission of the European Community.

Compliance with this directive implies conformity to the following European Norms (in brackets are the equivalent international standards).

- EN 60950 (IEC60950) – Product Safety
- EN 300 328 Technical requirement for radio equipment
- ETS 300 826 General EMC requirements for radio equipment.

To determine the type of transmitter, check the identification label on your Belkin product.

1

2

3

4

5

6

7

8

9

Products with the CE marking comply with the EMC Directive (89/336/EEC) and the Low Voltage Directive (72/23/EEC) issued by the Commission of the European Community. Compliance with these directives implies conformity to the following European Norms (in brackets are the equivalent international standards).

- EN 55022 (CISPR 22) – Electromagnetic Interference
- EN 55024 (IEC61000-4-2,3,4,5,6,8,11) – Electromagnetic Immunity
- EN 61000-3-2 (IEC610000-3-2) – Power Line Harmonics
- EN 61000-3-3 (IEC610000) – Power Line Flicker
- EN 60950 (IEC60950) – Product Safety

Products that contain the radio transmitter are labeled with CE 0682 or CE alert marking and may also carry the CE logo.

Belkin Corporation Limited Lifetime Product Warranty

Belkin Corporation warrants this product against defects in materials and workmanship for its lifetime. If a defect is discovered, Belkin will, at its option, repair or replace the product at no charge provided it is returned during the warranty period, with transportation charges prepaid, to the authorized Belkin dealer from whom you purchased the product. Proof of purchase may be required.

This warranty does not apply if the product has been damaged by accident, abuse, misuse, or misapplication; if the product has been modified without the written permission of Belkin; or if any Belkin serial number has been removed or defaced.

THE WARRANTY AND REMEDIES SET FORTH ABOVE ARE EXCLUSIVE IN LIEU OF ALL OTHERS, WHETHER ORAL OR WRITTEN, EXPRESSED OR IMPLIED. BELKIN SPECIFICALLY DISCLAIMS ANY AND ALL IMPLIED WARRANTIES, INCLUDING, WITHOUT LIMITATION, WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

No Belkin dealer, agent, or employee is authorized to make any modification, extension, or addition to this warranty.

BELKIN IS NOT RESPONSIBLE FOR SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES RESULTING FROM ANY BREACH OF WARRANTY, OR UNDER ANY OTHER LEGAL THEORY, INCLUDING BUT NOT LIMITED TO, LOST PROFITS, DOWNTIME, GOODWILL, DAMAGE TO OR REPROGRAMMING OR REPRODUCING ANY PROGRAM OR DATA STORED IN, OR USED WITH, BELKIN PRODUCTS.

Some states do not allow the exclusion or limitation of incidental or consequential damages or exclusions of implied warranties, so the above limitations or exclusions may not apply to you. This warranty gives you specific legal rights, and you may also have other rights that vary from state to state.
